AHRQ Quality Indicators – Guide to Patient Safety Indicators. Rockville, MD: Agency for Healthcare Research and Quality, 2003. Version 2.1, Revision 3, (January 17, 2005). AHRQ Pub.03-R203

Preface

In health care as in other arenas, that which cannot be measured is difficult to improve. Providers, consumers, policy makers, and others seeking to improve the quality of health care need accessible, reliable indicators of quality that they can use to flag potential problems or successes; follow trends over time; and identify disparities across regions, communities, and providers. As noted in a 2001 Institute of Medicine study, *Envisioning the National Health Care Quality Report*, it is important that such measures cover not just acute care but multiple dimensions of care: staying healthy, getting better, living with illness or disability, and coping with the end of life.

The Agency for Healthcare Research and Quality (AHRQ) Quality Indicators (QIs) are one Agency response to this need for multidimensional, accessible quality indicators. They include a family of measures that providers, policy makers, and researchers can use with inpatient data to identify apparent variations in the quality of inpatient or outpatient care. AHRQ's Evidence-Based Practice Center (EPC) at the University of California San Francisco (UCSF) and Stanford University adapted, expanded, and refined these indicators based on the original Healthcare Cost and Utilization Project (HCUP) Quality Indicators developed in the early 1990s.

The new AHRQ QIs are organized into three modules: **Prevention Quality Indicators**, **Inpatient Quality Indicators**, and **Patient Safety Indicators**. AHRQ has published the three modules as a series. The first module – Prevention Quality Indicators – was released in 2001 and the second module – Inpatient Quality Indicators – was released in 2002. Both are available at AHRQ's Quality Indicators Web site at <http://www.qualityindicators.ahrq.gov>.

This third module focuses on potentially preventable complications and iatrogenic events for patients treated in hospitals. The Patient Safety Indicators (PSIs) are measures that screen for adverse events that patients experience as a result of exposure to the health care system; these events are likely amenable to prevention by changes at the system or provider level. The PSIs were initially released in March 2003. The PSIs now include 23 Provider-level and 6 Area-level Indicators.

Full technical information on the first two modules can be found in *Refinement of the HCUP Quality Indicators*, prepared by the UCSF-Stanford EPC. It can be accessed at AHRQ's Quality Indicators Web site (<http://www.qualityindicators.ahrq.gov/downloads.htm>). The technical report for the third module, entitled *Measures of Patient Safety Based on Hospital Administrative Data—The Patient Safety Indicators*, is also available on AHRQ's Quality Indicators Web site.

Improving patient safety is a critical part of efforts to provide high quality health care in the United States. This guide is intended to facilitate such efforts. As always, we would appreciate hearing from those who use our measures and tools so that we can identify how they are used, how they can be refined, and how we can measure and improve the quality of the tools themselves. You may contact us by sending an e-mail to support@qualityindicators.ahrq.gov.

Irene Fraser, Ph.D., Director
Center for Organization and Delivery Studies

The programs for the Patient Safety Indicators (PSIs) can be downloaded from http://www.qualityindicators.ahrq.gov/psi_download.htm.

Instructions on how to use the programs to calculate the PSI rates are contained in the companion text, *Patient Safety Indicators: Software Documentation (both SAS and SPSS)*.

Acknowledgments

Support efforts, including refinement and enhancement of the AHRQ Quality Indicators and related products, are provided by the Support for Quality Indicators-II contract team.

The following individuals from **Battelle Memorial Institute, Stanford University, and University of California (UC)** constitute the Support for Quality Indicators-II core team:

Sheryl M. Davies, M.A.	Mark Gritz, Ph.D.	Kathryn M. McDonald, M.M.
Bruce Ellis, M.S.	Greg Hubert, B.S.	Patrick Romano, M.D., M.P.H.
Jeffrey Geppert, J.D.	Elaine Keller, M.Ed.	Jeff Schoenborn, BS

The **Agency for Healthcare Research and Quality** Support for Quality Indicators team includes:

Denise Remus, Ph.D., R.N., Project Officer	Mary B. Haines, Contract Officer
Mamatha Pancholi, M.S., Project Officer	

This product is based on the work of many individuals who contributed to its development and testing.

The following staff from the **Evidence-based Practice Center (EPC) at UCSF-Stanford** performed the evidence review, completed the empirical evaluation, and created the programming code and technical documentation for the AHRQ Quality Indicators:

Core Project Team

Kathryn M. McDonald, M.M. (Stanford),
principal investigator

Sheryl M. Davies, M.A. (Stanford)
Bradford W. Duncan, M.D. (Stanford)
Kaveh G. Shojania, M.D. (UCSF)

Investigators

Patrick S. Romano, M.D., M.P.H. (UC-Davis)
Jeffrey Geppert, J.D. (Stanford)

Angela Hansen, B.A. (Stanford), *EPC
Research Assistant*

The following staff from **Social & Scientific Systems, Inc.**, developed this software product, documentation, and guide:

Programmers

Leif Karell
Kathy McMillan
Fred Rohde

Technical Writer

Patricia Burgess

Graphics Designer

Laura Spofford

Contributors from the **Agency for Healthcare Research and Quality**:

Anne Elixhauser, Ph.D.
Denise Remus, Ph.D., R.N.
H. Joanna Jiang, Ph.D.

Marlene Miller, M.D., M.Sc.
Margaret Coopey, R.N., M.G.A, M.P.S.

We wish to also acknowledge the following individuals and organizations for their aid in this report: Doug Staiger, Dept. of Economics, Dartmouth College; Ros McNally, National Primary Care Research and Development Centre, University of Manchester; Rita Scichilone and the American Health Information Management Association; the various professional organizations that provided nominations for our clinical review panels; the clinical panelists; the peer reviewers of the evidence report; and the beta-testers of the software products, all of whose input was invaluable.

Introduction to the AHRQ Patient Safety Indicators

Hospitals in the United States provide the setting for some of life's most pivotal events—the birth of a child, major surgery, treatment for otherwise fatal illnesses. These hospitals house the most sophisticated medical technology in the world and provide state-of-the-art diagnostic and therapeutic services. But access to these services comes with certain costs. About 36% of personal health care expenditures in the United States go towards hospital care,¹ and the rate of growth in spending for hospital services has begun to increase following a half a decade of declining growth.² Simultaneously, concerns about the quality of health care services have reached a crescendo with the Institute of Medicine's series of reports describing the problem of medical errors³ and the need for a complete restructuring of the health care system to improve the quality of care.⁴ Policymakers, employers, and consumers have made the quality of care in U.S. hospitals a top priority and have voiced the need to assess, monitor, track, and improve the quality of inpatient care.

Hospital administrative data offer a window into the medical care delivered in our nation's hospitals. These data, which are collected as a routine step in the delivery of hospital services, provide information on diagnoses, procedures, age, gender, admission source, and discharge status. From these data elements, it is possible to construct a picture of the quality of medical care. Although quality assessments based on administrative data cannot be definitive, they can be used to flag potential quality problems and success stories, which can then be further investigated and studied. Hospital associations, individual hospitals, purchasers, regulators, and policymakers at the local, State, and Federal levels can use readily available hospital administrative data to begin the assessment of quality of care. In 2003, the Agency for Healthcare Research and Quality published the *National Healthcare Quality Report*⁵ (NHQR) and *National Healthcare Disparities Report*⁶ (NHDR) which provide a comprehensive picture of the level and variation of quality within four components of health care quality—effectiveness, safety, timeliness, and patient centeredness. These reports incorporated many Prevention Quality Indicators and Patient Safety Indicators and will include selected Inpatient Quality Indicators (IQIs) in the future.

The AHRQ Quality Indicators are now being used for applications beyond quality improvement. Some organizations have used the AHRQ Quality Indicators to produce web based, comparative reports on hospital quality, such as the Texas Health Care Information Council⁷ and the Niagara Coalition⁸. These organizations also supplied users with guidance on indicator interpretation. Other organizations have incorporated selected AHRQ QIs into pay for performance demonstration projects or similar programs, such as the Centers for Medicare and Medicaid Services (CMS)⁹ and Anthem Blue Cross Blue Shield of Virginia¹⁰ where hospitals would be financially rewarded for performance. Guidance on these

alternative uses of the AHRQ QIs is summarized in the AHRQ publication *Guidance for Using the AHRQ Quality Indicators for Hospital-Level Public Reporting or Payment*¹¹.

The Agency for Healthcare Research and Quality (AHRQ) Patient Safety Indicators (PSIs) are a tool that takes advantage of hospital administrative data. The PSIs represent the current state-of-the-art in measuring the safety of hospital care through analysis of inpatient discharge data.

This update of the AHRQ Patient Safety Indicators (PSIs) (Revision 3) incorporates updates to the ICD-9-CM and DRG codes for FY2005. In addition, the Census and empirical data used in the risk-adjustment have been updated to the most recent data available. The list of major operating room procedure codes, included as an Appendix in Revision 2, has been removed from this Guide and is now available as a separate document at http://www.qualityindicators.ahrq.gov/psi_download.htm. See the section "What Does this Guide Contain?" for more information about the operating room procedure codes.

What Are the Patient Safety Indicators?

The PSIs are a set of measures that can be used with hospital inpatient discharge data to provide a perspective on patient safety. Specifically, PSIs screen for problems that patients experience as a result of exposure to the healthcare system and that are likely amenable to prevention by changes at the system or provider level. These are referred to as complications or adverse events. PSIs are defined on two levels: the provider level and the area level.

- *Provider-level Indicators* provide a measure of the potentially preventable complication for patients who received their initial care and the complication of care within the same hospitalization. Provider-level Indicators include only those cases where a secondary diagnosis code flags a potentially preventable complication.
- *Area-level Indicators* capture all cases of the potentially preventable complication that occur in a given area (e.g., metropolitan service area or county) either during hospitalization or resulting in subsequent hospitalization. Area-level Indicators are specified to include principal diagnosis, as well as secondary diagnoses, for the complications of care. This specification adds cases where a patient's risk of the complication occurred in a separate hospitalization.

¹¹ Remus D, Fraser I. *Guidance for Using the AHRQ Quality Indicators for Hospital-level Public Reporting or Payment*. Rockville, MD: Department of Health and Human Services, Agency for Healthcare Research and Quality; 2004. AHRQ Pub. No. 04-0086-EF. The document and appendices can be downloaded from AHRQ's Quality Indicators Web site (<http://www.qualityindicators.ahrq.gov/documentation.htm>).

The PSIs include the following Provider-level Indicators:

Patient Safety Indicators - Provider	PSI Number
Complications of Anesthesia	1
Death in Low-Mortality DRGs	2
Decubitus Ulcer	3
Failure to Rescue	4
Foreign Body Left During Procedure	5
Iatrogenic Pneumothorax	6
Selected Infections Due to Medical Care	7
Postoperative Hip Fracture	8
Postoperative Hemorrhage or Hematoma	9
Postoperative Physiologic and Metabolic Derangements	10
Postoperative Respiratory Failure	11
Postoperative Pulmonary Embolism or Deep Vein Thrombosis	12
Postoperative Sepsis	13
Postoperative Wound Dehiscence	14
Accidental Puncture or Laceration	15
Transfusion Reaction	16
Birth Trauma – Injury to Neonate	17
Obstetric Trauma – Vaginal with Instrument	18
Obstetric Trauma – Vaginal without Instrument	19
Obstetric Trauma – Cesarean Delivery	20
Obstetric Trauma with 3 rd Degree Lacerations – Vaginal with Instrument	27
Obstetric Trauma with 3 rd Degree Lacerations – Vaginal without Instrument	28
Obstetric Trauma with 3 rd Degree Lacerations – Cesarean Delivery	29

In addition, the following PSIs were modified into Area-level Indicators to assess the total incidence of the adverse event within geographic areas:

Patient Safety Indicators - Area	PSI Number
Foreign Body Left During Procedure	21
Iatrogenic Pneumothorax	22
Selected Infections Due to Medical Care	23
Postoperative Wound Dehiscence	24
Accidental Puncture or Laceration	25
Transfusion Reaction	26

How Can the PSIs Be Used to Assess Patient Safety?

Widespread consensus exists that health care organizations can reduce patient injuries by improving the environment for safety—from implementing technical changes, such as electronic medical record systems, to improving staff awareness of patient safety risks. Clinical process interventions also have strong evidence for reducing the risk of adverse events related to a patient's exposure to hospital care.² PSIs, which are based on computerized hospital discharge abstracts from the AHRQ's Healthcare Cost and Utilization Project (HCUP), can be used to better prioritize and evaluate local and national initiatives. Analyses of these and similar inexpensive, readily available administrative data sets may provide a screen for potential medical errors and a method for monitoring trends over time. The following scenario illustrates one potential application of the PSIs.

Evaluating and Improving Quality of Care

A hospital association recognizes its member hospitals' need for information that can help them evaluate the quality of care they provide. There is significant interest in assessing, monitoring, and improving the safety of inpatient care. After learning about the AHRQ PSIs, the association decides to apply the indicators to the discharge abstract data submitted by individual hospitals. For each hospital, the association develops a report with graphic presentation of the risk-adjusted data to show how the hospital performs on each indicator compared to its peer group, the State as a whole, and other comparable States. National and regional averages from the AHRQ Healthcare Cost and Utilization Project (HCUP) database are also provided as additional external benchmarks. Three years of trend data are included to allow the hospital to examine any changing patterns in its performance.

One member hospital, upon receiving the report, convenes an internal work group comprised of clinicians and quality improvement professionals to review the information and identify potential areas for improvement. The hospital leadership is committed to performance excellence and providing a culture supportive of systems evaluation and redesign. To begin their evaluation, they apply the AHRQ software to their internal administrative data to distinguish those patients who experienced the complication or adverse event from those who did not. This step establishes the focus for chart review.

After the initial analysis of the administrative and clinical data, the work group meets with clinical departments involved in care of these patients. They begin an in-depth analysis of the system and processes of care. Through application of process improvement concepts, they begin to identify opportunities for improvement. After selection of their priority area (for example, reduction of postoperative complications), they begin work, including:

- Review and synthesize the evidence base and best practices from scientific literature.
- Work with the multiple disciplines and departments involved in care of surgical patients to redesign care based on best practices with an emphasis on coordination and collaboration.
- Evaluate information technology solutions.
- Implement performance measurements for improvement and accountability.
- Incorporate monitoring of performance measurements in the departmental and senior leadership meetings and include in the Board quality improvement reports.

What Does this Guide Contain?

This guide provides information that hospitals, State data organizations, hospital associations, and others can use to decide how to use the PSIs. First, it describes the origin of the entire family of AHRQ Quality Indicators. Second, it provides an overview of the methods used to identify, select, and evaluate the AHRQ PSIs. Third, the guide summarizes the PSIs specifically, describes strengths and limitations of the indicators, documents the evidence that links the PSIs to the quality of health care services, and then provides in-depth two-page descriptions of each PSI. Finally, two appendices present additional technical background information. Appendix A outlines the specific definitions of each PSI, with complete ICD-9-CM coding specifications. Appendix B provides the details of the empirical methods used to explore the PSIs. Appendix C summarizes all the revisions of the PSI Documentation, and Appendix D lists the changes in the ICD-9-CM codes specific to this update, PSI version 2.1, Revision 3.

A list of major operating room ICD-9-CM procedure codes, based on the AHRQ Procedure Classes is provided as a separate document at http://www.qualityindicators.ahrq.gov/psi_download.htm. The AHRQ Procedure Classes assign all ICD-9-CM procedure codes to one of four categories:

- Minor Diagnostic - Non-operating room procedures that are diagnostic (e.g., 87.03 CT scan of head)
- Minor Therapeutic - Non-operating room procedures that are therapeutic (e.g., 02.41 Irrigate ventricular shunt)
- Major Diagnostic - All procedures considered valid operating room procedures by the Diagnosis Related Group (DRG) grouper and that are performed for diagnostic reasons (e.g., 01.14 Open brain biopsy)
- Major Therapeutic - All procedures considered valid operating room procedures by the Diagnosis Related Group (DRG) grouper and that are performed for therapeutic reasons (e.g., 39.24 Aorta-renal bypass).

For the AHRQ Patient Safety Indicators (PSI), major operating room procedures are ICD-9-CM procedure codes in categories #3 (major diagnostic) and #4 (major therapeutic).

Support for Potential and Current Users of the AHRQ QIs

Technical assistance is available, through an electronic user support system monitored by the QI support team, to support users in their application of the PSI software. The same e-mail address may be used to communicate to AHRQ any suggestions for PSI enhancements, general questions, and any QI related comments you may have. AHRQ welcomes your feedback. The Internet address for user support and feedback is: support@qualityindicators.ahrq.gov. AHRQ also offers a listserv to keep you informed on the Quality Indicators (QIs). The listserv is used to announce any QI changes or updates, new tools and resources, and to distribute other QI related information. This is a free service. Sign-up information is available at the QI website at <http://www.qualityindicators.ahrq.gov/signup.htm>.

Origins and Background of the Quality Indicators

In the early 1990s, in response to requests for assistance from State-level data organizations and hospital associations with inpatient data collection systems, AHRQ developed a set of quality measures that required only the type of information found in routine hospital administrative data—diagnoses and major procedures, along with information on patient's age, gender, source of admission, and discharge status. These States were part of the Healthcare Cost and Utilization Project, an ongoing Federal-State-private sector collaboration to build uniform databases from administrative hospital-based data.

AHRQ developed these measures, called the HCUP Quality Indicators, to take advantage of a readily available data source—administrative data based on hospital claims—and quality measures that had been reported elsewhere.¹² The 33 HCUP QIs included measures for avoidable adverse outcomes, such as in-hospital mortality and complications of procedures; use of specific inpatient procedures thought to be overused, underused, or misused; and ambulatory care sensitive conditions.

Although administrative data cannot provide definitive measures of health care quality, they can be used to provide *indicators* of health care quality that can serve as the starting point for further investigation. The HCUP QIs have been used to assess potential quality-of-care problems and to delineate approaches for dealing with those problems. Hospitals with high rates of poor outcomes on the HCUP QIs have reviewed medical records to verify the presence of those outcomes and to investigate potential quality-of-care problems.¹³ For example, one hospital that detected high utilization rates for certain procedures refined patient selection criteria for these procedures to improve appropriate utilization.

Development of the AHRQ Quality Indicators

Since the original development of the HCUP QIs, the knowledge base on quality indicators has increased significantly. Risk-adjustment methods have become more readily available, new measures have been developed, and analytic capacity at the State level has expanded considerably. Based on input from current users and advances to the scientific base for specific indicators, AHRQ funded a project to refine and further develop the original QIs. The project was conducted by the UCSF-Stanford EPC.

The major constraint placed on the UCSF-Stanford EPC was that the measures could require only the type of information found in hospital discharge abstract data. Further, the data elements required by the measures had to be available from most inpatient administrative data systems. Some State data systems contain innovative data elements, often based on additional information from the medical record. Despite the value of these record-based data elements, the intent of this project was to create measures that were based on a *common denominator discharge data set*, without the need for additional data collection. This was critical for two reasons. First, this constraint would result in a tool that could be used with any inpatient administrative data, thus making it useful to most data systems. Second, this would enable national and regional benchmark rates to be provided using HCUP data, since these benchmark rates would need to be calculated using the universe of data available from the States.

AHRQ Quality Indicator Modules

The work of the UCSF-Stanford EPC resulted in the *AHRQ Quality Indicators*, which are distributed as three separate modules:

- **Prevention Quality Indicators.** These indicators consist of “ambulatory care sensitive conditions,” hospital admissions that evidence suggests could have been avoided through high-quality outpatient care or that reflect conditions that could be less severe, if treated early and appropriately.
- **Inpatient Quality Indicators.** These indicators reflect quality of care inside hospitals and include inpatient mortality; utilization of procedures for which there are questions of overuse, underuse, or misuse; and volume of procedures for which there is evidence that a higher volume of procedures is associated with lower mortality.
- **Patient Safety Indicators.** These indicators focus on potentially preventable instances of complications and other iatrogenic events resulting from exposure to the health care system.

Methods of Identifying, Selecting, and Evaluating the Quality Indicators

Since the literature surrounding PSIs is sparse, the project team used a variety of additional techniques to identify, select, and evaluate each indicator, including clinician panels, expert coders, and empirical analyses.

Step 1: Define the Concepts and the Evaluation Framework

In approaching the task of evaluating patient safety indicators based on administrative data, the project team developed a conceptual framework and standardized definitions of commonly used terms.

Standardized Definitions

In the literature, the distinctions between medical error, adverse events, complications of care, and other terms pertinent to patient safety are not well established and are often used interchangeably. In this report, the terms medical error, adverse events or complications, and similar concepts are defined as follows:

Case finding indicators. Indicators for which the primary purpose is to identify specific cases in which a medical error *may* have occurred, for further investigation.

Complication or adverse event. “An injury caused by medical management rather than by the underlying disease or condition of the patient.”¹⁴ In general, adverse events prolong the hospitalization, produce a disability at the time of discharge, or both. Used in this report, complication does not refer to the sequelae of diseases, such as neuropathy as a “complication” of diabetes. Throughout the report, “sequelae” is used to refer to these conditions.

Medical error. “The failure of a planned action to be completed as intended (i.e., error of execution) or the use of a wrong plan to achieve an aim (i.e., error of planning).” The definition includes errors committed by any individual, or set of individuals, working in a health care organization.¹⁵

Patient safety. “Freedom from accidental injury,” or “avoiding injuries or harm to patients from care that is intended to help them.” Ensuring patient safety “involves the establishment of operational systems and processes that minimize the likelihood of errors and maximizes the likelihood of intercepting them when they occur.”¹⁶

Patient safety indicators. Specific quality indicators which also reflect the quality of care inside hospitals, but focus on aspects of patient safety. Specifically, PSIs screen for problems that patients experience as a result of exposure to the healthcare system, and that are likely amenable to prevention by changes at the system or provider level.

Preventable adverse event. An adverse event attributable to error is a “preventable adverse event.”¹⁷ A condition for which reasonable steps may reduce (but not necessarily eliminate) the risk of that complication occurring.

¹⁶ Envisioning the National Health Care Quality Report. Washington, DC: Institute of Medicine; 2001.

¹⁷ Brennan et al., 1991.

Quality. “Quality of care is the degree to which health services for individuals and populations increase the likelihood of desired health outcomes and are consistent with current professional knowledge.” In this definition, “the term *health services* refers to a wide array of services that affect health...(and) applies to many types of health care practitioners (physicians, nurses, and various other health professionals) and to all settings of care...”¹⁸

Quality indicators. Screening tools for the purpose of identifying potential areas of concern regarding the quality of clinical care. For the purpose of this report, we focus on indicators that reflect the quality of care inside hospitals. Quality indicators may assess any of the four system components of health care quality, including patient safety (see below), effectiveness (i.e., “providing services based on scientific knowledge to all who could benefit, and refraining from providing services to those not likely to benefit), patient centeredness, and timeliness (i.e., “minimizing unnecessary delays”).¹⁹

Rate based indicators. Indicators for which the primary purpose is to identify the rate of a complication rather than to identify specific cases.

While the definitions above are intended to distinguish events that are less preventable from those that are more preventable, the difference is best described as a spectrum. To conceptualize this spectrum, the project team developed the following three categories of conditions:

1. **Conditions that could be either a comorbidity or a complication.** Conditions considered comorbidities (for example, congestive heart failure) are present on admission and are not caused by medical management; rather, they are due to the patient’s underlying disease. It is extremely difficult to distinguish complications from comorbidities for these conditions using administrative data. As a result, these conditions were not considered in this report.
2. **Conditions that are likely to reflect medical error.** These conditions (for example, foreign body accidentally left during a procedure) are likely to have been caused by medical error. Most of these conditions appear infrequently in administrative data, and thus rates of events lack the precision to allow for comparisons between providers. However, these conditions may be the subject of case-finding indicators.
3. **Conditions that conceivably, but not definitively reflect medical error.** These conditions (for example, postoperative DVT or PE) represent a spectrum of preventability between the previous two categories—from those that are mostly unpreventable to those that are mostly preventable. Because of the uncertainty regarding the preventability of these conditions and the likely heterogeneity of cases with the condition, indicators using these conditions are less useful as case-finding indicators. However, examining the rate of these conditions may highlight potential areas of concern.

Evaluation Framework

To evaluate the soundness of each indicator, the project team applied the same framework as was applied in the technical report²⁰ for the Prevention Quality Indicators (PQIs) and Inpatient Quality Indicators (IQIs), available at <http://www.qualityindicators.ahrq.gov/downloads.htm>. This included six areas of evidence:

¹⁸ Measuring the Quality of Health Care: A statement of the National Roundtable on Healthcare Quality Division of Healthcare Services: National Academy Press; 1999.

¹⁹ National Roundtable on Healthcare Quality, 1999.

²⁰ Davies S, Geppert J, McClellan M, McDonald KM, Romano PS, Shojania KG. Refinement of the HCUP Quality Indicators. Technical Review Number 4. Rockville, MD: (Prepared by UCSF-Stanford Evidence-based Practice Center under Contract No. 290-97-0013) Agency for Healthcare Research and Quality; 2001. Report No.: 01-0035.

- **Face validity.** Does the indicator capture an aspect of quality that is widely regarded as important and subject to provider or public health system control? Consensual validity expands face validity beyond one person to the opinion of a panel of experts.
- **Precision.** Is there a substantial amount of provider- or community-level variation that is not attributable to random variation?
- **Minimum bias.** Is there either little effect on the indicator of variations in patient disease severity and comorbidities, or is it possible to apply risk adjustment and statistical methods to remove most or all bias?
- **Construct validity.** Does the indicator perform well in identifying true (or actual) quality of care problems?
- **Fosters real quality improvement.** Is the indicator insulated from perverse incentives for providers to improve their reported performance by avoiding difficult or complex cases, or by other responses that do not improve quality of care?
- **Application.** Has the measure been used effectively in practice? Does it have potential for working well with other indicators?

Face validity (consensual validity) was evaluated using a structured panel review, minimum bias was explored empirically and briefly during the panel review, and construct validity was evaluated using the limited literature available. A full discussion of this framework is available in the Stanford Technical report²¹ available at <http://www.qualityindicators.ahrq.gov/downloads.htm>.

The relative importance of each of these evaluation areas may differ by individual PSIs. Precision and minimum bias may be less important for indicators that are primarily designed to screen only for medical error, since these events are relatively rare. In general, these indicators are better used as case-finding indicators. For these indicators, comparisons between rates are less relevant. However, for rate-based indicators, concerns of precision and minimum bias remain if indicators are used in any comparison of rates (comparison to national averages, peer group, etc.).

Step 2: Search the Literature to Identify Potential PSIs

The literature searches performed in connection with assessing potential AHRQ QIs²² identified many references relevant to potential PSIs. In addition, the project team performed electronic searches for articles published before February 2002 followed by hand searching the bibliographies of identified references. Members of the project team were queried to supplement this list, based on their personal knowledge of recent work in the field. Because Iezzoni et al.'s Complications Screening Program (CSP)²³ included numerous candidate indicators, the team also performed an author search using her name. Forthcoming articles and Federal reports in press, but not published, were also included when identified through personal contacts.

The project team identified 326 articles from the Medline search. Articles were screened using both the titles and abstracts. To qualify for abstraction, an article must have described, evaluated, or validated a potential indicator of medical errors, patient safety, or potentially preventable complications

based on International Classification for Diseases - Ninth Revision - Clinical Modifications (ICD-9-CM) coded administrative (hospital discharge or claims) data. Some indicators were also considered if they appeared to be readily translated into ICD-9-CM, even if the original authors did not use ICD-9-CM codes.

This search was adapted slightly and repeated using the OVID interface with EMBASE²⁴, limited to articles published from January 1990 through the end of first quarter 2002. The EMBASE search identified 463 references, and these articles were screened in the same manner. After elimination of articles that had already been identified using Medline²⁵ and the other approaches described above, only nine additional articles met the criteria for abstraction.

Step 3: Develop a Candidate List of PSIs

The project team developed a candidate list of PSIs by first reviewing the literature, then selecting a subset of indicators to undergo face validity testing by clinician panels.

Candidate List of PSIs

The literature search located relatively few patient safety indicators that could be defined using unlinked administrative data. The majority of these indicators were from the Complications Screening Program (CSP),²⁶ which was developed to identify potentially preventable complications of adult medical and surgical hospital care using commonly available administrative data. The algorithm uses discharge abstract data—specifically ICD-9-CM diagnosis and procedure codes, patient age, sex, diagnosis-related group (DRG), and date of procedure—to identify 28 complications that raise concern about the quality of care based on the rate of such occurrences at individual hospitals. Each of the complications is applied to some or all of the following specified “risk pools” separately: major surgery, minor surgery, invasive cardiac procedure, endoscopy, medical patients, and all patients. In addition, specified inclusion and exclusion criteria are applied to each complication to ensure that the complication developed in-hospital, as opposed to being present on admission, and that the complication was potentially preventable.

²⁴ EMBASE. In. The Netherlands: Elsevier Science Publishers B.V.

²⁵ MEDLINE [database online]. In. Bethesda (MD): National Library of Medicine.

²⁶ Iezzoni et al., 1992.

Four later studies were designed to test criterion and construct validity by validating the data used to construct CSP screens, validating the screens as a flag for actual quality problems, and validating the replicability of hospital-level results using different data sources.^{27 28 29 30} These studies raised concerns about the validity of the CSP, because flagged cases for most indicators were no more likely than unflagged controls to have suffered explicit process failures.

The project team also reviewed all ICD-9-CM codes implemented in or before 1999 that were identified by AHRQ as possibly describing medical errors or reflecting the consequences of such errors.³¹ (This initial set of indicators is referred to as the Miller et al. indicators.) The project team added relevant codes from the 2000 and 2001 revisions of ICD-9-CM and selected codes from the CSP, such as those not clearly reflective of medical error, but representing a potentially preventable complication. This process was guided principally by conceptual considerations. For example, codes for postoperative AMI (an evaluated indicator that was not included in the final indicator set) were included in the evaluation set since recent evidence suggests that AMI is a potentially preventable complication.³² A few codes were also deleted from the initial list based on a review of ICD-9-CM coding guidelines, described in *Coding Clinics for ICD-9-CM* and the *American Hospital Association's ICD-9-CM Coding Handbook*. For example, the code 2593 for hypoglycemic coma specifically excludes patients with diabetes mellitus, the population for which this complication is most preventable. This process of updating the Miller et al. PSIs resulted in a list of over 200 ICD-9-CM codes (valid in 2001) potentially related to medical error.

Codes identified in the CSP and updated from the Miller et. al. PSIs were then grouped into indicators. Where feasible, codes were compiled as they were in the CSP, or in some cases the Miller et al. PSIs, depending on which grouping yielded more clinically homogeneous groups. In most cases the resulting indicators were not identical to the CSP indicators, although they were closely related, as some of the specific codes included in the original CSP had been eliminated after the team's review of coding guidelines. The remaining codes were then incorporated into the most appropriate CSP-based indicator, or were grouped into clinically meaningful concepts to define novel indicators. Exclusion criteria were added based on CSP methods and clinical judgment. As a result, over 40 patient safety indicators were defined that, while building on prior work, reflected significantly changed measures to focus more narrowly on the most preventable complications.

Indicators were defined with both a numerator (complication of interest) and a denominator (population at risk). Different patient subpopulations have inherently different risks for developing a complication, with some patients having almost no risk. Thus, the denominator for each indicator represents the specific population at risk. The intention was to restrict the complication (and consequently the rate) to a more homogeneous population who are actually at risk for that complication. In general, the population at risk corresponded to one risk pool (e.g., major surgery) from the CSP, if applicable, or was defined more narrowly.

Rockville, MD: Agency for Healthcare Research and Quality; 2001. Report No.: AHRQ Publication No. 01-E058.

Subset Selection

After the project team developed a list of potential indicators, they selected a subset of indicators to undergo face validity testing by clinician panels, as described in Step 4. Two sources of information guided the selection process.

First, validation data from previous studies were reviewed and thresholds were set for retaining CSP-based indicators. Four studies were identified that evaluated the CSP indicators. Three of these studies, examined the predictive value of each indicator in identifying a complication that occurred in-hospital, regardless of whether this complication was due to medical error or was preventable.^{33 34 35} In a fourth study, nurses identified specific process failures that may have contributed to complications. In order to be retained as a potential PSI, at least one of the first three studies needed to demonstrate a positive predictive value of at least 75%, meaning that 3 out of 4 patients identified by the measure did indeed have the complication of interest.³⁶ In addition, the positive predictive value of a "process failure" identified in the fourth study needed to reach or exceed 46%, which was the average rate for surgical cases that were not flagged by any of the CSP indicators. As a result, only CSP-derived indicators that were at least somewhat predictive of objectively defined process failures or medical errors were retained.

Second, specific changes to previous definitions or constructs of indicators fell into the following general categories:

- Changes to the denominator definitions (inclusion or exclusion criteria), intended to reduce bias due to the inclusion of atypical patients or to improve generalizability to a broader set of patients at risk.
- Elimination of selected ICD-9-CM codes from numerator definitions, intended to focus attention on more clinically significant complications or complications more likely to result from medical errors.
- Addition of selected ICD-9-CM codes to numerator definitions, intended to capture related complications that could result from the same or similar medical errors.
- Division of a single indicator into two or more related indicators, intended to create more clinically meaningful and conceptually coherent indicators.
- Stratification or adjustment by relevant patient characteristics, intended to reflect fundamental clinical differences among procedures (e.g., vaginal delivery with or without instrumentation) and the complications that result from them, or fundamental differences in patient risk (e.g., decubitus ulcer in lower-risk versus high-risk patients).

A total of 34 indicators, intended to be applied to all age groups, were retained for face validity testing by clinician panels. Because the primary intent in developing these indicators was to detect potentially preventable complications related to health care exposure, the final definitions for this set of indicators represented mostly new measures that built upon previous work.

Coding Review

Experts in ICD-9-CM codes reviewed each code for accuracy of capturing the complication and population at risk. In some cases, additional codes or other refinements to the indicators were suggested based on current coding guidelines.

³⁴ McCarthy, et al., 2000.

³⁵ Weingart et al., 2000.

³⁶ Iezzoni et al., 1999.

Step 4: Review the PSIs

The project team conducted a structured review of each indicator to evaluate the face validity (from a clinical perspective) of the indicators. The methodology for the structured review was adapted from the RAND/UCLA Appropriateness Method³⁷ and consisted of an initial independent assessment of each indicator by clinician panelists using an initial questionnaire, a conference call among all panelists, followed by a final independent assessment by clinician panelists using the same questionnaire. The review sought to establish *consensual validity*, which “extends face validity from one expert to a panel of experts who examine and rate the appropriateness of each item....”³⁸ The panel process served to refine definitions of some indicators, add new measures, and dismiss indicators with major concerns from further consideration.

Eight panels were formed: two panels examined complications of medical care indicators, three panels examined surgical complications indicators, one panel assessed indicators related to procedural complications, and two panels examined obstetric complications indicators.

Fifteen professional clinical organizations nominated a total of 162 clinicians to be panelists. To be eligible to participate, nominees were required to spend at least 30% of their work time on patient care, including hospitalized patients. Nominees were asked to provide information regarding their practice characteristics, including specialty, subspecialty, and setting. Fifty-seven panelists were selected to ensure that each panel had diverse membership in terms of practice characteristics and setting.

Initial Assessment of the Indicators

Panelists were presented with four or five indicators, including the standardized text used to describe each ICD-9-CM code, the specific numeric code, exclusion and inclusion criteria, the clinical rationale for the indicator, and the specification criteria. For each indicator, panelists completed a 10-item questionnaire that evaluated the ability of the indicator to screen out conditions present on admission, the potential preventability of the complication, and the ability of the indicator to identify medical error. In addition, the questionnaire asked panelists to consider potential bias, reporting or charting problems, potential for gaming the indicator, and adverse effects of implementing the indicator. Finally, the questionnaire provided an opportunity for panelists to suggest changes to the indicator.

Conference Call Participation

After the panelists submitted the initial evaluation questionnaires, they participated in a 90-minute conference call for their panel to discuss the indicators. In general, agenda items for the conference call focused on points of disagreement among panelists. However, panelists were explicitly told that consensus was not the goal of discussion. In some cases, panelists agreed on proposed changes to the indicator definitions, and such consensus was noted and the definition was modified accordingly before the final round of rating.

Panelists were prompted throughout the process to consider the appropriate population at risk for each indicator (specifically inclusion and exclusion criteria) in addition to the complication of interest. However, if panelists wished to discuss other aspects of the indicator, this discussion was allowed within the time allotted for that indicator (approximately 15 minutes). If time remained at the end of a call, topics that were not fully addressed previously were revisited.

³⁸ Green L, Lewis F. measurement and Evaluation in Health Education and Health Promotion. Mountain View, CA: Mayfield Publishing Company; 1998.

Final Evaluation and Tabulation of Results

Following each conference call, the project team made changes to each indicator suggested by panelists for changes that reached near consensus of the panelists. The indicators were then redistributed to panelists with the questionnaires used in the initial evaluation. The reason for all each indicator definition change was included, and panelists were asked to re-rate the indicator based on their current opinion. They were asked to keep in mind the discussion during the conference call.

Results from the final evaluation questionnaire were used to calculate median scores from the 9-point scale for each question and to categorize the degree of agreement among panelists. Median scores determined the level of acceptability of the indicator, and dispersion of ratings across the panel for each applicable question determined the agreement status. Therefore the median and agreement status were independent measurements for each question. Six criteria were used to identify the panel opinions (i.e., median, agreement status category) on the following aspects of the indicator:

- Overall usefulness of the indicator.
- Likelihood that the indicator measures a complication and not a comorbidity (specifically, present on admission).
- Preventability of the complication.
- Extent to which the complication is due to medical error.
- Likelihood that the complication is charted given that it occurs.
- Extent that the indicator is subject to bias (systematic differences, such as case mix that could affect the indicator, in a way not related to quality of care).

The project team used the ratings of the overall appropriateness of each indicator to assess its overall usefulness as a screen for potential patient safety problems. Indicators were triaged into three sets: Accepted Indicators (described in this guide), Experimental Indicators, and Rejected Indicators.

Step 5: Evaluate the PSIs Using Empirical Analysis

The project team conducted empirical analyses to explore the frequency and variation of the indicators, the potential bias, based on limited risk adjustment, and the relationship between indicators. The data sources used in the empirical analyses were the 1997 Florida State Inpatient Database (SID) for initial testing and development and the 1997 HCUP State Inpatient Database for 19 States (referred to in this guide as the HCUP SID) for the final empirical analyses. The rates presented in the Detailed Evidence Section of this guide, as well as the means and parameter reference files used by the PSI software, reflect analyses of the 2002 HCUP SID for 35 states³⁹.

All potential indicators were examined empirically by developing and conducting statistical tests for precision, bias, and relatedness of indicators. Three different estimates of hospital performance were calculated for each indicator:

39 The state data organizations that participated in the 2002 HCUP SID: California Office of Statewide Health Planning & Development; Colorado Health & Hospital Association; Connecticut - Chime, Inc.; Florida Agency for Health Care Administration; Georgia: An Association of Hospitals & Health Systems; Hawaii Health Information Corporation; Illinois Health Care Cost Containment Council; Iowa Hospital Association; Kansas Hospital Association; Kentucky Department for Public Health; Maine Health Data Organization; Maryland Health Services Cost Review; Massachusetts Division of Health Care Finance and Policy; Michigan Health & Hospital Association; Minnesota Hospital Association; Missouri Hospital Industry Data Institute; Nebraska Hospital Association; Nevada Department of Human Resources; New Jersey Department of Health & Senior Services; New York State Department of Health; North Carolina Department of Health and Human Services; Ohio Hospital Association; Oregon Association of Hospitals & Health Systems; Pennsylvania Health Care Cost Containment Council; Rhode Island Department of Health; South Carolina State Budget & Control Board; South Dakota Association of Healthcare Organizations; Tennessee Hospital Association; Texas Health Care Information Council; Utah Department of Health; Vermont Association of Hospitals and Health Systems; Virginia Health Information; Washington State Department of Health; West Virginia Health Care Authority; Wisconsin Department of Health & Family Services.

1. The raw indicator rate was calculated using the number of adverse events in the numerator divided by the number of discharges in the population at risk by hospital.
2. The raw indicator was adjusted to account for differences among hospitals in age, gender, modified DRG, and comorbidities.
 - Adjacent DRG categories that were separated by the presence or absence of comorbidities or complications were collapsed to avoid adjusting for the complication being measured. Most of the super-Major Diagnostic Category (MDC) DRG categories were excluded for the same reason.
 - APR-DRG risk adjustment was not implemented because removing applicable complications from each indicator was beyond the scope of this project.
 - The ICD-9-CM codes used to define comorbidity categories were modified to exclude conditions likely to represent potentially preventable complications in certain settings.
 - “Acute on chronic” comorbidities were captured so that some patients with especially severe comorbidities would not be mislabeled as not having conditions of interest.
 - Comorbidities in obstetric patients were added.
3. Multivariate signal extraction methods were applied to adjust for reliability by estimating the amount of “noise” (i.e., variation due to random error) relative to the amount of “signal” (i.e., systematic variation in hospital performance or reliability) for each indicator.

Similar reliability adjustment has been used in the literature for similar purposes.^{40 41} The project team constructed a set of statistical tests to examine precision, bias, and relatedness of indicators for all accepted Provider-level Indicators, and precision and bias for all accepted Area-level Indicators. It should be noted that rates based on fewer than 30 cases in the numerator or the denominator are not reported. This exclusion rule serves two purposes:

- It eliminates unstable estimates based on too few cases.
- It helps protect the identities of hospitals and patients.

A detailed description of the methodology is included in Appendix B.

Summary Evidence on the Patient Safety Indicators

This project took a four-pronged approach to the identification, development, and evaluation of PSIs that included use of literature, clinician panels, expert coders, and empirical analyses. The literature review and the findings from the clinical panels combined with data analysis provide evidence to suggest that a number of discharge-based PSIs may be useful screens for organizations, purchasers, and policymakers to identify safety problems at the provider level, as well as to document systematic area-level differences in patient safety problems.

Most adverse events identified by the PSIs have a variety of causes in addition to potential medical error leading to the adverse event, including underlying patient health and factors that do not vary systematically. Clinician panelists rated only two of the accepted indicators as very likely to reflect medical error: (1) transfusion reaction and (2) foreign body left in during a procedure. These indicators proved to be very rare, with less than 1 per 10,000 cases at risk.

Table 1 summarizes the results of the literature review, clinician panels, and empirical analyses on the provider-level PSIs. Table 2 provides the same information for the area-level PSIs. The tables list each indicator, provide its definition, identify any concerns about its validity based on the clinician panels, and summarize the strength of evidence in the literature for each indicator.

The following notes about some of the terms in the table are intended to help the reader understand the context in which they are used.

Validity Concerns. The following concerns, raised during our panel review, are listed if they affect the validity of the particular indicator:

Rare — This indicator is relatively rare and may not have adequate statistical power for some providers.

Condition definition varies—This indicator includes conditions for which diagnosis may be subjective, depending on the threshold of the physician, and patients with the same clinical state may not have the same diagnosis.

Underreporting or screening—Conditions included in this indicator may not be systematically reported (leading to an artificially low rate) or may be routinely screened for (leading to a higher rate in facilities that screen).

Adverse consequences—Use of this indicator may have undesirable effects, such as increasing inappropriate antibiotic use.

Stratification suggested—This indicator includes some high risk patient groups and stratification is recommended when examining rates,

Unclear preventability—As compared to other PSIs, the conditions included in this indicator may be less preventable by the health system.

Heterogeneous severity—This indicator includes codes that encompass several levels of severity of a condition that cannot be ascertained by the codes.

Case mix bias—This indicator was felt to be particularly subject to systematic bias, and DRG and comorbidity risk adjustment may not adequately address the concern.

Denominator unspecific—The denominator for this indicator is less than ideal, because the true population at risk could not be identified using ICD-9-CM codes. Some patients are likely included who are not truly at risk, or some patients who are at risk are not included.

Empirical Performance. The performance of each indicator is measured for the following:

Rate—The rate measures the number of adverse events per 1,000 population at risk. Rates represent the average rate of the indicator for a nationwide sample of hospitals.

Deviation—Standard deviation is an estimate of systematic variation. For the PSIs, standard deviation is reported between providers.

Bias—Bias represents the degree to which the results may be influenced by outside factors. Bias ratings are based on a series of tests of bias using DRG and comorbidity risk adjustment. Those

indicators flagged with **X+** demonstrated substantial bias and should be risk adjusted. Those indicators flagged with **X** also demonstrated some bias. Those without a flag did not demonstrate substantial bias in empirical tests, but may nonetheless be substantially biased in a manner not detectable by the bias tests. Those marked with **N/A** did not undergo empirical testing of bias due to lack of systematic variation.

Strength of Evidence. The following key findings represent a review of the limited literature assessing the validity of the indicators:

Coding—Sensitivity is the proportion of patients who suffered an adverse event, based on detailed chart review or prospective data collection, for whom that event was coded on a discharge abstract or Medicare claim. Predictive value is the proportion of patients with a coded adverse event who were confirmed as having suffered that event, based on detailed chart review or prospective data collection.

Construct, explicit process—Adherence to specific, evidence-based or expert-endorsed processes of care, such as appropriate use of diagnostic modalities and effective therapies. The construct is that hospitals that provide better processes of care should experience fewer adverse events.

Construct, implicit process—Adherence to the “standard of care” for similar patients, based on global assessment of quality by physician chart reviewers. The construct is that hospitals that provide better overall care should experience fewer adverse events.

Construct, staffing—The construct is that hospitals that offer more nursing hours per patient day, better nursing skill mix, better physician skill mix, or more experienced physicians should have fewer adverse events.

The following distinctions were used to summarize the strength of the published evidence for each indicator:

- Published evidence suggests that the indicator lacks validity in this domain (i.e., less than 50% sensitivity or predictive value; explicit or implicit process failure rates no more frequent than among control patients).

0 No published evidence regarding this domain of validity.

± Published evidence suggests that the indicator may be valid in this domain, but different studies offer conflicting results (although study quality may account for these conflicts).

+ Published evidence suggests that the indicator is valid, or is likely to be valid, in this domain (i.e., one favorable study).

++ There is strong evidence supporting the validity of this indicator in this domain (i.e., multiple studies with consistent results, or studies showing both high sensitivity and high predictive value). When content validity is exceptionally high, as for transfusion reaction or iatrogenic pneumothorax, construct validity becomes less important.

A complete description of each PSI is included later in the guide under “Detailed Evidence for Patient Safety Indicators” and in Appendix A. Details on the empirical methods can be found in Appendix B.

Table 1: AHRQ Provider-Level Patient Safety Indicators

PSI Name	Definition	Validity Concerns	Empirical Performance ^b	Strength of Evidence
Complications of Anesthesia (PSI 1)	Cases of anesthetic overdose, reaction, or endotracheal tube misplacement per 1,000 surgery discharges. Excludes codes for drug use and self-inflicted injury.	Condition definition varies Underreporting or screening Denominator unspecific	Provider Rate = 0.72 Provider SD = 1.77 Pop. Rate = 0.79 Bias = Not detected ^c	0 Coding 0 Explicit Process 0 Implicit Process 0 Staffing
Death in Low Mortality DRGs (PSI 2)	In-hospital deaths per 1,000 patients in DRGs with less than 0.5% mortality. ^a Excludes trauma, immuno-compromised, and cancer patients.	Heterogeneous severity	Provider Rate = 3.03 Provider SD = 25.05 Pop. Rate = 0.73 Bias = X+	+ Coding 0 Explicit Process + Implicit Process 0 Staffing
Decubitus Ulcer (PSI 3)	Cases of decubitus ulcer per 1,000 discharges with a length of stay of 5 or more days. Excludes patients with paralysis or in MDC 9, obstetrical patients in MDC 14, and patients admitted from a long-term care facility.	Underreporting or screening Heterogeneous severity Case mix bias	Provider Rate = 27.61 Provider SD = 37.23 Pop. Rate = 24.75 Bias = X+	– Coding 0 Explicit Process 0 Implicit Process ± Staffing
Failure to Rescue (PSI 4)	Deaths per 1,000 patients having developed specified complications of care during hospitalization. Excludes patients age 75 and older, neonates in MDC 15, patients admitted from long-term care facility and patients transferred to or from other acute care facility.	Adverse consequences Stratification suggested Unclear preventability Heterogeneous severity	Provider Rate = 110.82 Provider SD = 91.49 Pop. Rate = 131.83 Bias = X+	+ Coding 0 Explicit Process 0 Implicit Process ++ Staffing
Foreign Body Left During Procedure (PSI 5)	Discharges with foreign body accidentally left in during procedure per 1,000 discharges	Rare Stratification suggested Denominator unspecific	Provider Rate = 0.06 Provider SD = 0.22 Pop. Rate = 0.08 Bias = N/A	0 Coding 0 Explicit Process 0 Implicit Process 0 Staffing
Iatrogenic Pneumothorax (PSI 6)	Cases of iatrogenic pneumothorax per 1,000 discharges. Excludes trauma, thoracic surgery, lung or pleural biopsy, or cardiac surgery patients, and obstetrical patients in MDC 14.	Denominator unspecific	Provider Rate = 0.60 Provider SD = 1.83 Pop. Rate = 0.79 Bias = X	0 Coding 0 Explicit Process 0 Implicit Process 0 Staffing

PSI Name	Definition	Validity Concerns	Empirical Performance ^b	Strength of Evidence
Selected Infections Due to Medical Care (PSI 7)	Cases of secondary ICD-9-CM codes 9993 or 00662 per 1,000 discharges. Excludes patients with immunocompromised state or cancer.	Underreporting or screening Adverse consequences	Provider Rate = 2.25 Provider SD = 7.71 Pop. Rate = 2.31 Bias = X	0 Coding 0 Explicit Process 0 Implicit Process 0 Staffing
Postoperative Hip Fracture (PSI 8)	Cases of in-hospital hip fracture per 1,000 surgical discharges. Excludes patients in MDC 8, with conditions suggesting fracture present on admission and obstetrical patients in MDC 14.	Case mix bias Denominator unspecific	Provider Rate = 0.85 Provider SD = 16.89 Pop. Rate = 0.30 Bias = X	+ Coding + Explicit Process + Implicit Process 0 Staffing
Postoperative Hemorrhage or Hematoma (PSI 9)	Cases of hematoma or hemorrhage requiring a procedure per 1,000 surgical discharges. Excludes obstetrical patients in MDC 14.	Stratification suggested Case mix bias Denominator unspecific	Provider Rate = 2.14 Provider SD = 16.84 Pop. Rate = 2.17 Bias = Not detected	± Coding ± Explicit Process + Implicit Process 0 Staffing
Postoperative Physiologic and Metabolic Derangement (PSI 10)	Cases of specified physiological or metabolic derangement per 1,000 elective surgical discharges. Excludes patients with principal diagnosis of diabetes and with diagnoses suggesting increased susceptibility to derangement. Excludes obstetric admissions.	Condition definition varies	Provider Rate = 1.28 Provider SD = 18.18 Pop. Rate = 1.07 Bias = X	– Coding 0 Explicit Process 0 Implicit Process – Staffing
Postoperative Respiratory Failure (PSI 11)	Cases of acute respiratory failure per 1,000 elective surgical discharges. Excludes MDC 4 and 5 and obstetric admissions.	Unclear preventability Case mix bias	Provider Rate = 5.89 Provider SD = 33.94 Pop. Rate = 4.29 Bias = X+	+ Coding ± Explicit Process + Implicit Process ± Staffing
Postoperative PE or DVT (PSI 12)	Cases of deep vein thrombosis or pulmonary embolism per 1,000 surgical discharges. Excludes obstetric patients.	Underreporting or screening Stratification suggested	Provider Rate = 9.11 Provider SD = 29.85 Pop. Rate = 8.83 Bias = X+	+ Coding + Explicit Process + Implicit Process ± Staffing
Postoperative Sepsis (PSI 13)	Cases of sepsis per 1,000 elective surgery patients, with length of stay more than 3 days. Excludes principal diagnosis of infection, or any diagnosis of immunocompromised state or cancer, and obstetric admissions.	Condition definition varies Adverse consequences	Provider Rate = 16.79 Provider SD = 50.25 Pop. Rate = 11.8 Bias = X+	± Coding 0 Explicit Process 0 Implicit Process – Staffing

PSI Name	Definition	Validity Concerns	Empirical Performance ^b	Strength of Evidence
Postoperative Wound Dehiscence (PSI 14)	Cases of reclosure of postoperative disruption of abdominal wall per 1,000 cases of abdominopelvic surgery. Excludes obstetric admissions.	Case mix bias	Provider Rate = 1.87 Provider SD = 4.34 Pop. Rate = 1.95 Bias = X	0 Coding 0 Explicit Process 0 Implicit Process 0 Staffing
Accidental Puncture or Laceration (PSI 15)	Cases of technical difficulty (e.g., accidental cut or laceration during procedure) per 1,000 discharges. Excludes obstetric admissions.	Underreporting or screening Unclear preventability	Provider Rate = 2.22 Provider SD = 2.68 Pop. Rate = 3.47 Bias = X+	± Coding 0 Explicit Process 0 Implicit Process 0 Staffing
Transfusion Reaction (PSI 16)	Cases of transfusion reaction per 1,000 discharges.	Rare Stratification suggested	Provider Rate = 0.005 Provider SD = 0.055 Pop. Rate = 0.005 Bias = N/A	0 Coding 0 Explicit Process 0 Implicit Process 0 Staffing
Birth Trauma—Injury to Neonate (PSI 17)	Cases of birth trauma, injury to neonate, per 1,000 liveborn births. Excludes some preterm infants and infants with osteogenic imperfecta.	Condition definition varies Unclear preventability Heterogeneous severity	Provider Rate = 6.13 Provider SD = 21.66 Pop. Rate = 6.59 Bias = N/A	– Coding 0 Explicit Process 0 Implicit Process 0 Staffing
Obstetric Trauma—Vaginal Delivery with Instrument (PSI 18)	Cases of obstetric trauma (4 th degree lacerations, other obstetric lacerations) per 1,000 instrument-assisted vaginal deliveries.	Unclear preventability Case mix bias	Provider Rate = 200.13 Provider SD = 138.28 Pop. Rate = 213.74 Bias = N/A	+ Coding 0 Explicit Process 0 Implicit Process 0 Staffing
Obstetric Trauma—Vaginal Delivery without Instrument (PSI 19)	Cases of obstetric trauma (4 th degree lacerations, other obstetric lacerations) per 1,000 vaginal deliveries without instrument assistance.	Unclear preventability Case mix bias	Provider Rate = 78.32 Provider SD = 63.85 Pop. Rate = 80.83 Bias = N/A	+ Coding 0 Explicit Process 0 Implicit Process 0 Staffing
Obstetric Trauma—Cesarean Delivery (PSI 20)	Cases of obstetric trauma (4 th degree lacerations, other obstetric lacerations) per 1,000 Cesarean deliveries.	Unclear preventability Case mix bias	Provider Rate = 5.01 Provider SD = 14.10 Pop. Rate = 5.43 Bias = N/A	+ Coding 0 Explicit Process 0 Implicit Process 0 Staffing
Obstetric Trauma with 3 rd Degree—Vaginal Delivery with Instrument (PSI 27)	Cases of obstetric trauma (3 rd and 4 th degree lacerations, other obstetric lacerations) per 1,000 instrument-assisted vaginal deliveries.	Unclear preventability Case mix bias	Provider Rate = 234.55 Provider SD = 149.03 Pop. Rate = 237.81 Bias = N/A	+ Coding 0 Explicit Process 0 Implicit Process 0 Staffing

PSI Name	Definition	Validity Concerns	Empirical Performance ^b	Strength of Evidence
Obstetric Trauma with 3 rd Degree —Vaginal Delivery without Instrument (PSI 28)	Cases of obstetric trauma (3 rd and 4 th degree lacerations, other obstetric lacerations) per 1,000 vaginal deliveries without instrument assistance.	Unclear preventability Case mix bias	Provider Rate = 86.21 Provider SD = 65.32 Pop. Rate = 86.21 Bias = N/A	+ Coding 0 Explicit Process 0 Implicit Process 0 Staffing
Obstetric Trauma with 3 rd Degree — Cesarean Delivery (PSI 29)	Cases of obstetric trauma (3 rd and 4 th degree lacerations, other obstetric lacerations) per 1,000 Cesarean deliveries.	Unclear preventability Case mix bias	Provider Rate = 5.15 Provider SD = 14.15 Pop. Rate = 5.61 Bias = N/A	+ Coding 0 Explicit Process 0 Implicit Process 0 Staffing

^a DRGs that are divided into “with complications and comorbidities” and “without complications and comorbidities” are only included if both divisions have mortality rates below 0.5%.

^b Notes under **Empirical Performance**:

Provider Rates - Observed (unadjusted) and unweighted rates for providers (hospitals) and their standard deviations (SD) were calculated using the HCUP Year 2002 SID from 35 states. Provider rates are per 1,000.

Population Rates - The population rates are weighted provider rates (weighted by the number of discharges for each indicator).

Table 2. AHRQ Area Level Patient Safety Indicators

PSI Name	Definition	Validity Concerns	Empirical Performance ^a	Strength of Evidence
Foreign Body Left During Procedure (PSI 21)	Discharges with foreign body accidentally left in during procedure per 100,000 population		Area Rate = 1.22 Area SD = 3.28 Pop. Rate = 1.11	
Iatrogenic Pneumothorax (PSI 22)	Cases of iatrogenic pneumothorax per 100,000 population. Excludes trauma, thoracic surgery, lung or pleural biopsy, or cardiac surgery patients, and obstetrical patients in MDC 14.		Area Rate = 9.11 Area SD = 9.53 Pop. Rate = 8.45	
Selected Infections Due to Medical Care (PSI 23)	Cases of secondary ICD-9-CM codes 999.3 or 996.62 per 100,000 population. Excludes patients with immunocompromised state or cancer.		Area Rate = 35.19 Area SD = 23.53 Pop. Rate = 42.97	
Postoperative Wound Dehiscence (PSI 24)	Cases of reclosure of postoperative disruption of abdominal wall per 100,000 population. Excludes obstetric admissions.		Area Rate = 2.73 Area SD = 4.78 Pop. Rate = 2.35	

PSI Name	Definition	Validity Concerns	Empirical Performance ^a	Strength of Evidence
Accidental Puncture or Laceration (PSI 25)	Cases of technical difficulty (e.g., accidental cut or laceration during procedure) per 100,000 population. Excludes obstetric admissions.		Area Rate = 43.30 Area SD = 26.80 Pop. Rate = 36.79	
Transfusion Reaction (PSI 26)	Cases of transfusion reaction per 100,000 population.		Area Rate = 0.09 Area SD = 0.89 Pop. Rate = 0.06	

- ^a Notes under **Empirical Performance**:
- Area Rates** - Observed (unadjusted) and unweighted rates for areas (counties) and their standard deviations (SD) were based on 1371 geographic areas (counties) in the HCUP Year 2002 SID from 35 states. Area rates are per 100,000.
- Population Rates** - The population rates are weighted area rates (weighted by the area populations).

Limitations in Using the PSIs

Many important concerns cannot currently be monitored well using administrative data, such as adverse drug events, and using these data tends to favor specific types of indicators. For example, the PSIs evaluated in this report contain a large proportion of surgical indicators, rather than medical or psychiatric, because medical complications are often difficult to distinguish from comorbidities that are present on admission. In addition, medical populations tend to be more heterogeneous than surgical, especially elective surgical populations, making it difficult to account for case-mix. Panelists often expressed that indicators were more applicable to patient safety when limited to elective surgical admissions. However, the careful use of administrative data holds promise for screening to target further data collection and analysis. The ability to assess all patients at risk for a particular patient safety problem, along with the relative low cost, are particular strengths of these data sets.

Two broad areas of concern also hold true for these data sets.

- Questions about the clinical accuracy of discharge-based diagnosis coding lead to concerns about the interpretation of reported diagnoses that may represent safety problems. Specifically:
 - Administrative data are unlikely to capture all cases of a complication, regardless of the preventability, without false positives and false negatives (sensitivity and specificity).
 - When the codes are accurate in defining an event, the clinical vagueness inherent in the description of the code itself (e.g., “hypotension”), may lead to a highly heterogeneous pool of clinical states represented by that code.
 - Incomplete reporting is an issue in the accuracy of any data source used for identifying patient safety problems, as medical providers might fear adverse consequences as a result of “full disclosure” in potentially public records such as discharge abstracts.
- The information about the ability of these data to distinguish adverse events in which no error occurred from true medical errors is limited. A number of factors—such as the heterogeneity of clinical conditions included in some codes, lack of information about event timing available in these data sets, and limited clinical detail for risk adjustment—contribute to the difficulty in identifying complications that represent medical error or may be at least in some part preventable.

These factors may exist for other sources of patient safety data as well. For example, they have been raised in the context of the Joint Commission on Accreditation of Healthcare Organizations (JCAHO) implementation of a “sentinel event” program geared at identifying serious adverse events that may be related to underlying safety problems.

Further Research on PSIs

The initial validation evaluations reviewed and performed for the PSIs leave substantial room for further research with detailed chart data and other data sources. Future validation work should focus on the following:

- The sensitivity and specificity of these indicators in detecting the occurrence of a complication.
- The extent to which failures in processes of care at the system or individual level are detected using these indicators.
- The relationship of these indicators with other measures of quality, such as mortality.
- Further explorations of bias and risk adjustment.

Enhancements to administrative data are worth exploring in the context of further validation studies that use data from other sources. For example, as with other quality indicators, the addition of timing variables may prove particularly useful in identifying whether a complication was present on admission, or whether it occurred during the hospitalization. While some of the complications that are present on admission may indeed reflect adverse events of care in a previous hospitalization or outpatient care, many may reflect comorbidities instead of complications. A second example area—linking hospital data over time and with outpatient data and other hospitalizations—would allow inclusion of complications that occur after discharge and likely would increase the sensitivity of the PSIs.

Use of External Cause-of-Injury Codes

Several of the PSIs are based on capturing external cause-of-injury (e-code) data. These codes are used to classify environmental events, circumstances, and conditions as the cause of injury, poisoning, or other adverse events. External cause-of-injury codes are critical to evaluate population-based, cause-specific data on nonfatal injuries at the state and local levels. However, not all states collect this information in their hospital discharge data programs nor do all state uniform billing committees require use of e-codes. Users of the PSIs should be knowledgeable of the e-code requirements and practices of hospitals represented in the input data file.

Table 3 provides a summary of the PSIs that are dependent on e-codes for their definition (required), the PSIs that use e-codes within their definition, and the PSIs that do not use any e-codes in their definition. If use of e-codes is not mandated or coding may be highly variable across hospitals, the PSIs that are dependent upon e-codes should not be used and the PSIs that include e-codes in their definition should be used with caution.

Table 3: Indicators and Use of External Cause-of-Injury Codes

Indicator Number (used in software)	Indicator Name	Use of External Cause-of-Injury Codes
15 & 25	Accidental puncture or laceration	Required. Used in both the numerator and denominator definitions.
17	Birth trauma	Not used.
1	Complications of anesthesia	Required. Used in the numerator definition.
2	Death in low mortality DRGs	Not used.
3	Decubitus ulcer	Not used.
4	Failure to rescue	Not used.
5 & 21	Foreign body left during procedure	Required. Used in the numerator definition although the other ICD-9 CM codes may capture the same information.
6 & 22	Iatrogenic pneumothorax	Not used.
20 & 29	Obstetric trauma – cesarean section	Not used.
18 & 27	Obstetric trauma – vaginal with instrument	Not used.
19 & 28	Obstetric trauma – vaginal without instrument	Not used.
9	Postoperative hemorrhage or hematoma	Not used.
8	Postoperative hip fracture	Used as exclusion criteria in denominator population.
10	Postoperative physiologic and metabolic derangements	Not used.
12	Postoperative pulmonary embolism or deep vein thrombosis	Not used.
11	Postoperative respiratory failure	Not used.
13	Postoperative sepsis	Not used.
14 & 24	Postoperative wound dehiscence	Not used.
7 & 23	Selected infections due to medical care	Not used.
16 & 26	Transfusion reaction	Required. Used in the numerator definition although the other ICD-9 CM codes may capture the same information.

Detailed Evidence for Patient Safety Indicators

This section provides an abbreviated presentation of the details of the literature review and the empirical evaluation for each PSI, including:

- The definition of the indicator
- The outcome of interest (or numerator)
- The population at risk (or denominator)
- The type of indicator
- The measures of empirical performance. Rates are population rates as reported in Table 1 (PSI – Provider) and Table 2 (PSI – Area). Provider rates are per 1,000 qualifying discharges and Area rates are per 100,000 population.

The two-page descriptions for each indicator also include a more detailed discussion of the panel review, the literature review, the source of the indicator, and the results of the empirical analysis, including information related to adjustments to increase the robustness of the rates:

- Reliability. Statistics on the signal standard deviation, signal share, and signal ratio were used to examine the effect of the reliability adjustment. Multivariate methods were applied to most of the indicators, and overall the reliability adjustment reduced the provider-level variation dramatically. In general, indicators with higher rates tend to perform better on tests of reliability; as a result, obstetric indicators with high rates tend to do very well relative to other indicators.
- Bias. The effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals — compared to no risk adjustment — was assessed, if applicable. The presence of high bias suggests that risk adjustment, using administrative data elements, is necessary to interpret provider-level differences in the rates of these indicators.

A full report on the literature review and empirical evaluation can be found in "Measures of Patient Safety Based on Hospital Administrative Data — The Patient Safety Indicators" by the UCSF-Stanford EPC, available at <http://www.qualityindicators.ahrq.gov/documentation.htm>. Detailed coding information for each PSI is provided in Appendix A.

The software manual Patient Safety Indicators: SAS Software Documentation, Version 2.1 (also available at http://www.qualityindicators.ahrq.gov/psi_download.htm) provides detailed instructions on how to use the PSI software including data preparation, calculation of the PSI rates, and interpretation of output. All provider level indicators are expressed as rates per 1,000 discharges. To obtain the standardized rate for each provider level PSIs, the output of the software should be multiplied by 1,000. The area level indicators are expressed as rates per 100,000 population. To obtain the standardized area rate for each area level PSIs, the output of the software should be multiplied by 100,000.

Complications of Anesthesia (PSI 1)

Definition	Cases of anesthetic overdose, reaction, or endotracheal tube misplacement per 1,000 surgery discharges with an operating room procedure. See page A-1.
Numerator	Discharges with ICD-9-CM diagnosis codes for anesthesia complications in any secondary diagnosis field.
Denominator	All surgical discharges defined by specific DRGs and an ICD-9-CM code for an operating room procedure. Exclude patients with ICD-9-CM diagnosis codes for anesthesia complications in the principal diagnosis field Exclude patients with codes for poisoning due to anesthetics (E8551, 9681-4, 9687) and any diagnosis code for active drug dependence, active non-dependent abuse of drugs, or self-inflicted injury.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 0.79 per 1,000 population at risk Bias: Not detected, but may be biased in a way undetectable by empirical tests
Risk Adjustment	Age, sex, DRG, comorbidity categories

Summary

This indicator is intended to capture cases flagged by external cause-of-injury codes (e-codes) and complications codes for adverse effects from the administration of therapeutic drugs, as well as the overdose of anesthetic agents used primarily in therapeutic settings.

Panel Review

Panelists had concerns about the frequency of coding of these complications, especially since the use of e-codes is considered voluntary and appears to vary widely among providers. Plausibly, a “reaction” may be described without attributing it to anesthetic. Another concern is that some of these cases would be present on admission (e.g., due to recreational drug use).

Panelists expressed concern about the events that would be assigned to the code for incorrect placement of endotracheal tube. They noted that true misplacement does represent medical error, but they were skeptical about whether this code would be limited to those situations.

Ideally, this indicator would be used with a coding designation that distinguishes conditions present on admission from those that develop

in-hospital. However, this is not available in the administrative data used to define this indicator, and so this concern was addressed by eliminating codes for drugs that are commonly used as recreational drugs. While this does not eliminate the chance that these codes represent intentional or accidental overdose on the part of the patient, it should eliminate many of these cases.

Literature Review

The literature review focused on the validity of complication indicators based on ICD-9-CM diagnosis or procedure codes. Results of the literature review indicate no published evidence for the sensitivity or predictive value of this indicator based on detailed chart review or prospective data collection. Sensitivity is the proportion of the patients who suffered an adverse event for whom that event was coded on a discharge abstract or Medicare claim. Predictive value is the proportion of patients with a coded adverse event who were confirmed as having suffered that event.

The project team found no published evidence for this indicator that supports the following constructs: (1) that hospitals that provide better processes of care experience fewer adverse events; (2) that hospitals that provide better

overall care experience fewer adverse events; and (3) that hospitals that offer more nursing hours per patient day, better nursing skill mix, better physician skill mix, or more experienced physicians have fewer adverse events.

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Complications of Anesthesia generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is 75.7%, suggesting that observed differences in risk-adjusted rates likely reflect true differences across hospitals.

The signal standard deviation for this indicator is 0.00187, indicating that the systematic differences (signal) among hospitals is lower than many indicators and less likely associated with hospital characteristics. The signal share is 0.00563, and is also lower than many indicators. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Complications of Anesthesia is low, indicating that the measures are likely not biased based on the characteristics observed. (It is possible that characteristics that are not observed using administrative data may be related to the patient's risk of experiencing an adverse event.)

Source

A subset of this indicator was originally proposed by Iezzoni et al.⁴² as part of Complications Screening Program (CSP) (CSP 21, “Complications relating to anesthetic agents and other CNS depressants”) Their definition also includes poisoning due to centrally acting muscle relaxants and accidental poisoning by nitrogen oxides, which were omitted from this PSI. Their definition excludes other codes included in the PSI, namely, poisoning by other and unspecified general anesthetics and external cause of injury codes for “endotracheal tube wrongly place during anesthetic procedure” and adverse effects of anesthetics in therapeutic use.

⁴² Iezzoni LI, Daley J, Heeren T, Foley SM, Fisher ES, Duncan C, et al. Identifying complications of care using administrative data. *Med Care* 1994;32(7):700-15.

Death in Low-Mortality DRGs (PSI 2)

Definition	In-hospital deaths per 1,000 patients in DRGs with less than 0.5% mortality. See page A-8.
Numerator	Discharges with disposition of “deceased”.
Denominator	Patients in DRGs with less than 0.5% mortality rate, based on NIS 1997 low-mortality DRG. If a DRG is divided into “without/with complications,” both DRGs must have mortality rates below 0.5% to qualify for inclusion. Exclude patients with any code for trauma, immunocompromised state, or cancer.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 0.73 per 1,000 population at risk Bias: Substantial bias; should be risk-adjusted
Risk Adjustment	Age, sex, DRG, comorbidity categories

Summary

This indicator is intended to identify in-hospital deaths in patients unlikely to die during hospitalization. The underlying assumption is that when patients admitted for an extremely low-mortality condition or procedure die, a health care error is more likely to be responsible. Patients experiencing trauma or having an immunocompromised state or cancer are excluded, as these patients have higher non-preventable mortality.

Panel Review

This indicator should be evaluated separately by type of DRG when used as an indicator of quality. For example, the PSI Software reports the low-mortality DRG rate for all the included DRGs and separately by DRG type: adult medical, adult surgical (with and without an operating room procedure), pediatric medical, pediatric surgical (with and without an operating room procedure), and obstetric and psychiatric. The overall usefulness of this indicator was rated as favorable by panelists. Because the denominator includes many heterogeneous patients cared for by different services, this indicator should be stratified by DRG type (i.e., medical, surgical, psychiatric, obstetric, pediatric) when used as an indicator of quality.

Panelists noted that hospital case-mix may affect the rate of death in low mortality DRGs, and patients referred from skilled nursing

facilities, those with certain comorbidities, and older patients may be at higher risk of dying. They advocated risk adjustment for comorbidities and age.

Panelists advocated that this indicator not be subject to public reporting because of the potential bias and questions about the extent of preventability.

Literature Review

Based on two-stage implicit review of randomly selected deaths, Hannan et al. found that patients in low-mortality DRGs (<0.5%) were 5.2 times more likely than all other patients who died (9.8% versus 1.7%) to have received “care that departed from professionally recognized standards,” after adjusting for patient demographic, geographic, and hospital characteristics.⁴³ In 15 of these 26 cases (58%) of substandard care, the patient’s death was attributed at least partially to that care. The association with substandard care was stronger for the DRG-based definition of this indicator than for the procedure-based definition (5.7% versus 1.7%, OR=3.2). The project team was unable to find other evidence on the validity of this indicator.

⁴³ Hannan EL, Bernard HR, O'Donnell JF, Kilburn H, Jr. A methodology for targeting hospital cases for quality of care record reviews. *Am J Public Health* 1989;79(4):430-6.

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Death in Low-mortality DRGs generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is high, relative to other indicators, at 94.2%, suggesting that observed differences in risk-adjusted rates likely reflect true differences across hospitals.

The signal standard deviation for this indicator is lower than many indicators, at 0.00439, indicating that the systematic differences (signal) among hospitals is low and less likely associated with hospital characteristics. The signal share is high, relative to other indicators, at 0.04237. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Death in Low-mortality DRGs is high, indicating that the measures are biased based on the characteristics observed. (It is possible that characteristics that are not observed using administrative data may be related to the patient's risk of experiencing an adverse event.) Risk adjustment is important for this indicator.

Source

This indicator was originally proposed by Hannan et al. as a criterion for targeting “cases that would have a higher percentage of quality of care problems than cases without the criterion,

as judged by medical record review.”⁴⁴ An alternative form of this indicator focused on “primary surgical procedures,” rather than DRGs, with less than 0.5% inpatient mortality.

⁴⁴ Hannan et al. 1989.

Decubitus Ulcer (PSI 3)

Definition	Cases of decubitus ulcer per 1,000 discharges with a length of stay greater than 4 days. See page A-16.
Numerator	Discharges with ICD-9-CM code of decubitus ulcer in any secondary diagnosis field.
Denominator	All medical and surgical discharges defined by specific DRGs. Include only patients with a length of stay of 5 or more days. Exclude patients with ICD-9-CM code of decubitus ulcer in the principal diagnosis field. Exclude patients in MDC-9 or patients with any diagnosis of hemiplegia, paraplegia, or quadriplegia. Exclude obstetrical patients in MDC 14. Exclude patients admitted from a long-term care facility.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 24.75 per 1,000 population at risk Bias: Substantial bias; should be risk-adjusted
Risk Adjustment	Age, sex, DRG, comorbidity categories

Summary

This indicator is intended to flag cases of in-hospital decubitus ulcers. Its definition is limited to decubitus ulcer as a secondary diagnosis to better screen out cases that may be present on admission. In addition, this indicator excludes patients who have a length of stay of 4 days or less, as it is unlikely that a decubitus ulcer would develop within this period of time. Finally, this indicator excludes patients who are particularly susceptible to decubitus ulcer, namely patients with major skin disorders (MDC 9) and paralysis.

Panel Review

The overall usefulness of this indicator was rated as very favorable by panelists. Concerns regarding the systematic screening for ulcers and reliability of coding, especially for early stage ulcers, brought into question that assertion. Therefore, this indicator appears to be best used as a rate-based indicator. Panelists suggested that patients admitted from a long-term care facility be excluded, as these patients may have an increased risk of having decubitus present on admission.

Panelists noted that hospitals that routinely screen for decubitus ulcers as part of a quality improvement program might have an artificially

high rate of ulcers compared to other hospitals, which may cause this indicator to be somewhat biased.

This indicator includes pediatric patients. Pressure sores are very unusual in children, except among the most critically ill children (who may be paralyzed to improve ventilator management) and children with chronic neurological problems. Age stratification is recommended.

Literature Review

Coding validity. No evidence on validity is available from CSP studies. Geraci et al. confirmed only 2 of 9 episodes of pressure ulcers reported on discharge abstracts of Veterans Affairs (VA) patients hospitalized in 1987-89 for congestive heart failure (CHF), chronic obstructive pulmonary disease (COPD), or diabetes.⁴⁵ The sensitivity for a nosocomial ulcer was 40%. Among Medicare hip fracture

⁴⁵ Geraci JM, Ashton CM, Kuykendall DH, Johnson ML, Wu L. International Classification of Diseases, 9th Revision, Clinical Modification codes in discharge abstracts are poor measures of complication occurrence in medical inpatients. *Med Care* 1997;35(6):589-602.

patients, Keeler et al. confirmed 6 of 9 reported pressure ulcers, but failed to ascertain 89 additional cases (6% sensitivity) using ICD-9-CM codes.⁴⁶ In the largest study to date, Berlowitz et al. found that the sensitivity of a discharge diagnosis of pressure ulcer among all patients transferred from VA hospitals to VA nursing homes in 1996 was 31% overall, or 54% for stage IV (deep) ulcers.⁴⁷ The overall sensitivity increased modestly since 1992 (26.0%), and was slightly but statistically significantly better among medical patients than among surgical patients (33% versus 26%).

Construct validity. Needleman and Buerhaus found that nurse staffing was inconsistently associated with the occurrence of pressure ulcers among medical patients, and was independent of pressure ulcers among major surgery patients.⁴⁸ As was expected, nursing skill mix (RN hours/licensed nurse hours) was significantly associated with the pressure ulcer rate.⁴⁹ Total licensed nurse hours per acuity-adjusted patient day were inconsistently associated with the rate of pressure ulcers.

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Decubitus Ulcer generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is high, relative to other indicators, at 85.6%, suggesting that

⁴⁹ Lichtig LK, Knauf RA, Hiholland DK. Some impacts of nursing on acute care hospital outcomes. J Nurs Adm 1999;29(2):25-33.

observed differences in risk-adjusted rates likely reflect true differences across hospitals.

The signal standard deviation for this indicator is lower than many indicators, at 0.0147, indicating that the systematic differences (signal) among hospitals is low and less likely associated with hospital characteristics. The signal share is lower than many indicators, at 0.01067. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Decubitus Ulcer is high, indicating that the measure is biased based on the characteristics observed. (It is possible that characteristics that are not observed using administrative data may be related to the patient's risk of experiencing an adverse event.) Risk adjustment is important for this indicator.

Source

This indicator was originally proposed by Iezzoni et al.⁵⁰ as part of the Complications Screening Program (CSP 6, "cellulitis or decubitus ulcer"). Needleman and Buerhaus identified decubitus ulcer as an "outcome potentially sensitive to nursing."⁵¹ The American Nurses Association, its State associations, and the California Nursing Outcomes Coalition have identified the total prevalence of inpatients with Stage I, II, III, or IV pressure ulcers as a "nursing-sensitive quality indicator for acute care settings."⁵²

⁵² Nursing-Sensitive Quality Indicators for Acute Care Settings and ANA's Safety & Quality Initiative. In: American Nurses Association; 1999.

Failure to Rescue (PSI 4)

Definition	Deaths per 1,000 patients having developed specified complications of care during hospitalization. See page A-22.
Numerator	Discharges with a disposition of “deceased”.
Denominator	Discharges with potential complications of care listed in failure to rescue definition (i.e., pneumonia, DVT/PE, sepsis, acute renal failure, shock/cardiac arrest, or GI hemorrhage/acute ulcer). Exclusion criteria specific to each diagnosis. Exclude patients age 75 years and older. Exclude neonatal patients in MDC 15. Exclude patients transferred to an acute care facility. Exclude patients transferred from an acute care facility. Exclude patients admitted from a long-term care facility.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 131.83 per 1,000 population at risk Bias: Substantial bias; should be risk-adjusted
Risk Adjustment	Age, sex, DRG, comorbidity categories

Summary

This indicator is intended to identify patients who die following the development of a complication. The underlying assumption is that good hospitals identify these complications quickly and treat them aggressively.

Failure to Rescue may be fundamentally different than other indicators reviewed in this report, as it may reflect different aspects of quality of care (effectiveness in rescuing a patient from a complication versus preventing a complication). This indicator includes pediatric patients. It is important to note that children beyond the neonatal period inherently recover better from physiological stress and thus may have a higher rescue rate.

Panel Review

Panelists expressed concern regarding patients with “do not resuscitate” (DNR) status. In cases where this DNR status is not a direct result of poor quality of care, it would be contrary to patient desire and poor quality of care to rescue a patient. In addition, very old patients—or patients with advanced cancer or HIV—may not desire or may be particularly difficult to rescue

from these complications. As a result, this indicator definition was modified to exclude those patients age 75 years and older. In addition, panelists suggested the exclusion of patients admitted from long-term care facilities.

Panelists noted that several adverse incentives may be introduced by implementing this indicator. In particular, since some type of adjustment may be desirable, this indicator may encourage the upcoding of complications and comorbidities to inflate the denominator or manipulate risk adjustment. Others noted that this indicator could encourage irresponsible resource use and allocation, although this is likely to be a controversial idea. Finally, panelists emphasized that this indicator should be used internally by hospitals, as it is not validated for public reporting.

Literature Review

Construct validity. Silber and colleagues have published a series of studies establishing the construct validity of failure-to-rescue rates through their associations with hospital characteristics and other measures of hospital performance. Among patients admitted for cholecystectomy and transurethral

prostatectomy, failure to rescue was independent of severity of illness at admission, but was significantly associated with the presence of surgical house staff and a lower percentage of board-certified anesthesiologists.⁵³ The adverse occurrence rate was independent of this hospital characteristic. In a larger sample of patients who underwent general surgical procedures, lower failure-to-rescue rates were found at hospitals with high ratios of registered nurses to beds.⁵⁴ Failure rates were strongly associated with risk-adjusted mortality rates, as expected, but not with complication rates.⁵⁵

More recently, Needleman and Buerhaus confirmed that higher registered nurse staffing (RN hours/adjusted patient day) and better nursing skill mix (RN hours/licensed nurse hours) were consistently associated with lower failure-to-rescue rates, even using administrative data to define complications.⁵⁶

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Failure to Rescue generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is moderately high, relative to other indicators, at 66.6%, suggesting that observed differences in risk-adjusted rates

may reflect true differences across hospitals.

The signal standard deviation for this indicator is also high, relative to other indicators, at 0.04617, indicating that the systematic differences (signal) among hospitals is high and more likely associated with hospital characteristics. The signal share is lower than many indicators, at 0.01450. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Failure to Rescue is high, indicating that the measures are biased based on the characteristics observed. (It is possible that characteristics that are not observed using administrative data may be related to the patient's risk of experiencing an adverse event.) Risk adjustment is important for this indicator.

Source

This indicator was originally proposed by Silber et al. as a more powerful tool than the risk-adjusted mortality rate to detect true differences in patient outcomes across hospitals.⁵⁷ The underlying premise was that better hospitals are distinguished not by having fewer adverse occurrences but by more successfully averting death among (i.e., rescuing) patients who experience such complications. More recently, Needleman and Buerhaus adapted Failure to Rescue to administrative data sets, hypothesizing that this outcome might be sensitive to nurse staffing.⁵⁸

Foreign Body Left During Procedure, Provider Level (PSI 5)

Provider Level Definition (only secondary diagnosis)

Definition	Discharges with foreign body accidentally left in during procedure per 1,000 discharges. See page A-34.
Numerator	Discharges with ICD-9-CM codes for foreign body left in during procedure in any secondary diagnosis field.
Denominator	All medical and surgical discharges defined by specific DRGs. Exclude patients with ICD-9-CM codes for foreign body left in during procedure in the principal diagnosis field
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 0.08 per 1,000 population at risk Bias: Did not undergo empirical testing of bias
Risk Adjustment	Age, sex, DRG, comorbidity categories

Foreign Body Left During Procedure, Area Level (PSI 21)

Area Level Definition (principal or secondary diagnosis)

Definition	Discharges with foreign body accidentally left in during procedure per 100,000 population. See page A-34.
Numerator	Discharges with ICD-9-CM codes for foreign body left in during procedure in any diagnosis field (principal or secondary) of medical and surgical discharges defined by specific DRGs.
Denominator	Population of county or MSA associated with FIPS code of patient's residence or hospital location.
Type of Indicator	Area level
Empirical Performance	Population Rate (2002): 1.11 per 100,000 population
Risk Adjustment	No risk adjustment

Summary

This indicator is intended to flag cases of a foreign body accidentally left in a patient during a procedure. This indicator is defined on both a provider level (by restricting cases to those flagged by a secondary diagnosis or procedure code) and an area level (by including all cases).

Panel Review

Panelists believed that this indicator was useful in identifying cases of a foreign body left in during a procedure. However, they suggested that each case identified be examined carefully by the hospital, because this indicator was likely to yield few cases and some automated systems

report this complication when a foreign body is left in intentionally.

Panelists also noted that the population at risk included both medical and surgical patients, but not all of these patients are at risk. The panelists felt that limiting the population at risk to surgical patients would decrease the sensitivity of this indicator substantially. Since not all patients in the denominator are actually at risk, some hospitals may appear to have a lower rate if they have fewer medical patients who have undergone invasive procedures.

Literature Review

The literature review focused on the validity of complication indicators based on ICD-9-CM diagnosis or procedure codes. Results of the literature review indicate no published evidence for the sensitivity or predictive value of this indicator based on detailed chart review or prospective data collection. Sensitivity is the proportion of the patients who suffered an adverse event for whom that event was coded on a discharge abstract or Medicare claim. Predictive value is the proportion of patients with a coded adverse event who were confirmed as having suffered that event.

The project team found no published evidence for this indicator that supports the following constructs: (1) that hospitals that provide better processes of care experience fewer adverse events; (2) that hospitals that provide better overall care experience fewer adverse events; and (3) that hospitals that offer more nursing hours per patient day, better nursing skill mix, better physician skill mix, or more experienced physicians have fewer adverse events.

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Foreign Body Left During Procedure generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time. Due to the rarity of this diagnosis, reliability and bias were not assessed.

Source

This indicator was originally proposed by Iezzoni et al. as part of the Complications Screening Program (CSP “sentinel events”).⁵⁹ It was also included as one component of a broader indicator (“adverse events and iatrogenic complications”) in AHRQ’s original HCUP Quality Indicators.⁶⁰ It was proposed by Miller et al. in the “Patient Safety Indicator Algorithms and Groupings.”⁶¹ Based on expert consensus

panels, McKesson Health Solutions included this indicator in its CareEnhance Resource Management Systems, Quality Profiler Complications Measures Module.

Iatrogenic Pneumothorax, Provider Level (PSI 6)

Provider Level Definition (only secondary diagnosis)

Definition	Cases of iatrogenic pneumothorax per 1,000 discharges. See page A-35.
Numerator	Discharges with ICD-9-CM code of 512.1 in any secondary diagnosis field.
Denominator	All medical and surgical discharges defined by specific DRGs. Excluded patients with ICD-9-CM code of 512.1 in the principal diagnosis field. Exclude patients with any diagnosis of trauma. Exclude patients with any code indicating thoracic surgery or lung or pleural biopsy or assigned to cardiac surgery DRGs. Exclude obstetrical patients in MDC 14.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 0.79 per 1,000 population at risk Bias: Some bias demonstrated
Risk Adjustment	Age, sex, DRG, comorbidity categories

Iatrogenic Pneumothorax, Area Level (PSI 22)

Area Level Definition (principal or secondary diagnosis)

Definition	Cases of iatrogenic pneumothorax per 100,000 population. See page A-35.
Numerator	Discharges with ICD-9-CM code of 512.1 in any diagnosis field (principal or secondary) of medical and surgical discharges defined by specific DRGs. Exclude patients with any diagnosis of trauma. Exclude patients with any code indicating thoracic surgery or lung or pleural biopsy or assigned to cardiac surgery DRGs. Exclude obstetrical patients in MDC 14.
Denominator	Population of county or MSA associated with FIPS code of patient's residence or hospital location.
Type of Indicator	Area level
Empirical Performance	Population Rate (2002): 8.45 per 100,000 population
Risk Adjustment	No risk adjustment

Summary

This indicator is intended to flag cases of pneumothorax caused by medical care. This indicator is defined on both a provider level (by including cases of iatrogenic pneumothorax occurring as a secondary diagnosis during hospitalization) and on an area level (by including all cases of iatrogenic pneumothorax).

Iatrogenic pneumothorax excludes all trauma patients because these patients may be more

susceptible to non-preventable iatrogenic pneumothorax or may be miscoded for traumatic pneumothorax. The smaller anatomy of children, especially neonates, may increase the technical complexity of these procedures in this population (however, these procedures are less likely to be performed in unmonitored settings).

Panel Review

Panelists rated the overall usefulness of this indicator favorably. The denominator of the

definition that the panelists rated was limited to patients receiving a central line, Swan-Ganz catheter, or thorocentesis. However, exploratory empirical analyses found that this definition could not be operationalized using administrative data, as these procedures appeared to be under-reported. Although the panelists noted that this complication, given the definition rated, reflected medical error, the actual final definition of this indicator includes cases that may be less reflective of medical error. Specifically, this indicator includes patients in whom a pneumothorax resulted from barotrauma, including patients with acute respiratory distress syndrome.

Panelists expressed concern that some approaches of placing a central line (e.g., subclavian) may be more likely to result in pneumothorax than other approaches (e.g., internal jugular). However, other complications—such as complications of the carotid artery—would be more common with internal jugular approaches. Thus, if providers simply change approach, they may have a decrease in pneumothorax but an increase in other unmeasured complications.

Literature Review

The literature review focused on the validity of complication indicators based on ICD-9-CM diagnosis or procedure codes. Results of the literature review indicate no published evidence for the sensitivity or predictive value of this indicator based on detailed chart review or prospective data collection. Sensitivity is the proportion of the patients who suffered an adverse event for whom that event was coded on a discharge abstract or Medicare claim. Predictive value is the proportion of patients with a coded adverse event who were confirmed as having suffered that event.

The project team found no published evidence for this indicator that supports the following constructs: (1) that hospitals that provide better processes of care experience fewer adverse events; (2) that hospitals that provide better overall care experience fewer adverse events; and (3) that hospitals that offer more nursing hours per patient day, better nursing skill mix, better physician skill mix, or more experienced physicians have fewer adverse events.

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Iatrogenic Pneumothorax generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is moderately high, relative to other indicators, at 79.9%, suggesting that observed differences in risk-adjusted rates may reflect true differences across hospitals.

The signal standard deviation for this indicator is lower than many indicators, at 0.00143, indicating that the systematic differences (signal) among hospitals is low and less likely associated with hospital characteristics. The signal share is lower than many indicators, at 0.00183. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Iatrogenic Pneumothorax is moderate, indicating that the measures may or may not be substantially biased based on the characteristics observed.

Source

This diagnosis code was proposed by Miller et al. as one component of a broader indicator (“iatrogenic conditions”) in the “Patient Safety Indicator Algorithms and Groupings.”⁶² It was also included as one component of a broader indicator (“adverse events and iatrogenic complications”) in AHRQ’s Version 1.3 HCUP Quality Indicators.

Selected Infections Due to Medical Care, Provider Level (PSI 7)

Provider Level Definition (only secondary diagnosis)

Definition	Cases of ICD-9-CM codes 9993 or 99662 per 1,000 discharges. See page A-38.
Numerator	Discharges with ICD-9-CM code of 9993 or 99662 in any secondary diagnosis field.
Denominator	All medical and surgical discharges defined by specific DRGs. Exclude patients with ICD-9-CM code of 9993 or 99662 in the principal diagnosis field. Exclude patients with any diagnosis code for immunocompromised state or cancer.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 2.31 per 1,000 population at risk Bias: Some bias demonstrated
Risk Adjustment	Age, sex, DRG, comorbidity categories

Selected Infections Due to Medical Care, Area Level (PSI 23)

Area Level Definition (principal or secondary diagnosis)

Definition	Cases of ICD-9-CM codes 9993 or 99662 per 100,000 population. See page A-38.
Numerator	Discharges with ICD-9-CM code of 9993 or 99662 in any diagnosis field (principal or secondary) of medical and surgical discharges defined by specific DRGs. Exclude patients with any diagnosis code for immunocompromised state or cancer.
Denominator	Population of county or MSA associated with FIPS code of patient's residence or hospital location.
Type of Indicator	Area level
Empirical Performance	Population Rate (2002): 42.97 per 100,000 population
Risk Adjustment	No risk adjustment

Summary

This indicator is intended to flag cases of infection due to medical care, primarily those related to intravenous (IV) lines and catheters. This indicator is defined both on a provider level (by including cases based on secondary diagnosis associated with the same hospitalization) and on an area level (by including all cases of such infection). Patients with potential immunocompromised states (e.g., AIDS, cancer, transplant) are excluded, as they may be more susceptible to such infection.

This indicator includes children and neonates. It should be noted that high-risk neonates are at particularly high risk for catheter-related infections.

Panel Review

Panelists expressed particular interest in tracking IV and catheter-related infections, despite the potential for bias due to charting or under-reporting. For the most part, they felt that these complications were important to track. As

with other indicators tracking infections, concern regarding the potential overuse of prophylactic antibiotics remains.

Literature Review

The literature review focused on the validity of complication indicators based on ICD-9-CM diagnosis or procedure codes. Results of the literature review indicate no published evidence for the sensitivity or predictive value of this indicator based on detailed chart review or prospective data collection. Sensitivity is the proportion of the patients who suffered an adverse event for whom that event was coded on a discharge abstract or Medicare claim. Predictive value is the proportion of patients with a coded adverse event who were confirmed as having suffered that event.

The project team found no published evidence for this indicator that supports the following constructs: (1) that hospitals that provide better processes of care experience fewer adverse events; (2) that hospitals that provide better overall care experience fewer adverse events; and (3) that hospitals that offer more nursing hours per patient day, better nursing skill mix, better physician skill mix, or more experienced physicians have fewer adverse events.

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Selected Infections Due to Medical Care generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is moderately high, relative to other indicators, at 70.8%, suggesting that observed differences in risk-adjusted rates may reflect true differences across hospitals.

The signal standard deviation for this indicator is lower than many indicators, at 0.00134, indicating that the systematic differences (signal) among hospitals is low and less likely associated with hospital characteristics. The signal share is lower than many indicators, at 0.00095. The signal share is a measure of the share of total variation (hospital and patient)

accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Selected Infections Due to Medical Care is moderate, indicating that the measures may or may not be substantially biased based on the characteristics observed. (It is possible that characteristics that are not observed using administrative data may be related to the patient's risk of experiencing an adverse event.)

Source

This indicator was originally proposed by Iezzoni et al. as part of the Complications Screening Program (CSP 11, “miscellaneous complications”).⁶³ The University HealthSystem Consortium adopted the CSP indicator for major (#2933) and minor (#2961) surgery patients. A much narrower definition, including only 9993 (“other infection after infusion, injection, transfusion, vaccination”), was proposed by Miller et al. in the “Patient Safety Indicator Algorithms and Groupings.”⁶⁴ The American Nurses Association and its State associations have identified the number of laboratory-confirmed bacteremic episodes associated with central lines per critical care patient day as a “nursing-sensitive quality indicator for acute care settings.”⁶⁵

⁶⁵ Nursing-Sensitive Quality Indicators for Acute Care Settings and ANA's Safety and Quality Initiative. In: American Nurses Association; 1999.

Postoperative Hip Fracture (PSI 8)

Definition	Cases of in-hospital hip fracture per 1,000 surgical discharges with an operating room procedure. See page A-40.
Numerator	Discharges with ICD-9-CM code for hip fracture in any secondary diagnosis field.
Denominator	<p>All surgical discharges defined by specific DRGs and an ICD-9-CM code for an operating room procedure.</p> <p>Exclude patients with ICD-9-CM code for hip fracture in the principal diagnosis field, cases where the only operating room procedure is hip fracture repair, or where a procedure for hip fracture repair occurs before the first operating room procedure.</p> <p><i>Note: If day of procedure is not available in the input data file, the rate may be slightly lower than if the information was available.</i></p> <p>Exclude all patients with diseases and disorders of the musculoskeletal system and connective tissue (MDC 8); patients with principal diagnosis codes for seizure, syncope, stroke, coma, cardiac arrest, anoxic brain injury, poisoning, delirium or other psychoses, or trauma; with any diagnosis of metastatic cancer, lymphoid malignancy, bone malignancy or self-inflicted injury; obstetrical patients in MDC 14; or patients 17 years of age or younger.</p>
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 0.30 per 1,000 population at risk Bias: Some bias demonstrated
Risk Adjustment	Age, sex, DRG, comorbidity categories

Summary

This indicator is intended to capture cases of in-hospital fracture—specifically, hip fractures. This indicator limits diagnosis codes to secondary diagnosis codes to eliminate fractures that were present on admission. It further excludes patients in MDC 8 (musculoskeletal disorders) and patients with indications for trauma or cancer, or principal diagnoses of seizure, syncope, stroke, coma, cardiac arrest, or poisoning, as these patients may have a fracture present on admission. This indicator is limited to surgical cases since previous research suggested that these codes in medical patients often represent conditions present on admission (see Literature Review).

Panel Review

Although this indicator was initially presented as "In-hospital hip fracture and fall," panelists unanimously suggested that falls should be eliminated from this indicator and that all in-hospital fractures should be included. The

resulting indicator was termed "In-hospital fracture possibly related to falls." Children were excluded after empirical analysis revealed that they did not have a substantial number of cases in the numerator.

Panelists noted that this indicator may be slightly biased for hospitals that care for more of the elderly and frail, because they have weaker bones and are more susceptible to falls.

Panelists were interested in capturing all fractures occurring in-hospital, although it was not possible to operationalize this suggestion.

Literature Review

Coding validity. The original CSP definition had an adequate confirmation rate among major surgical cases in Medicare inpatient claims files (57% by coders' review, 71% by physicians' review), but a very poor confirmation rate among medical cases (11% by both coders' and

physicians' review).^{66 67} This problem was attributable to the fact that most hip fractures among medical inpatients were actually comorbid diagnoses present at admission rather than complications of hospital care. Nurse reviews were not performed.

Construct validity. Explicit process of care failures in the CSP validation study were relatively frequent among cases with CSP 25 (76% of major surgery patients, 54% of medical patients), after excluding patients who had hip fractures at admission, but unflagged controls were not evaluated on the same criteria.⁶⁸ Physician reviewers identified potential quality problems in 24% of major surgery patients and 5% of medical patients with CSP 25 (versus 2% of unflagged controls for each risk group).⁶⁹

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Postoperative Hip Fracture generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is moderately high, relative to other indicators, at 67.1%, suggesting that observed differences in risk-adjusted rates may reflect true differences across hospitals.

The signal standard deviation for this indicator is lower than many indicators, at 0.00184, indicating that the systematic differences (signal) among hospitals is low and less likely associated with hospital characteristics. The signal share is lower than many indicators, at

0.00403. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Postoperative Hip Fracture is moderate, indicating that the measures may or may not be substantially biased based on the characteristics observed. (It is possible that characteristics that are not observed using administrative data may be related to the patient's risk of experiencing an adverse event.)

Source

This indicator was originally proposed by Iezzoni et al.⁷⁰ as part of the Complications Screening Program (CSP 25, "in-hospital hip fracture or fall"). Their definition also includes any documented fall, based on external cause of injury codes. Needleman and Buerhaus considered in-hospital hip fracture as an "Outcome Potentially Sensitive to Nursing," but discarded it because the "event rate was too low to be useful."⁷¹ The American Nurses Association, its State associations, and the California Nursing Outcomes Coalition have identified the number of patient falls leading to injury per 1,000 patient days (based on clinical data collection) as a "nursing-sensitive quality indicator for acute care settings."⁷²

Postoperative Hemorrhage or Hematoma (PSI 9)

Definition	Cases of hematoma or hemorrhage requiring a procedure per 1,000 surgical discharges with an operating room procedure. See page A-44.
Numerator	Discharges with ICD-9-CM codes for postoperative hemorrhage or postoperative hematoma in any secondary diagnosis field and code for postoperative control of hemorrhage or drainage of hematoma (respectively) in any procedure code field.
Denominator	<p>All surgical discharges defined by specific DRGs and an ICD-9-CM code for an operating room procedure.</p> <p>Exclude patients with ICD-9-CM codes for postoperative hemorrhage or postoperative hematoma in the principal diagnosis field</p> <p>Exclude patients where the only operating room procedure is postoperative control of hemorrhage or drainage of hematoma.</p> <p>Exclude patients where a procedure for postoperative control of hemorrhage or drainage of hematoma occurs before the first operating room procedure.</p> <p><i>Note: If day of procedure is not available in the input data file, the rate may be slightly lower than if the information was available.</i></p> <p>Exclude obstetrical patients in MDC 14.</p>
Type of Indicator	Provider level
Empirical Performance	<p>Population Rate (2002): 2.17 per 1,000 population at risk</p> <p>Bias: Not detected in empirical tests</p>
Risk Adjustment	Age, sex, DRG, comorbidity categories

Summary

This indicator is intended to capture cases of hemorrhage or hematoma following a surgical procedure. This indicator limits hemorrhage and hematoma codes to secondary procedure and diagnosis codes, respectively, to isolate those hemorrhages that can truly be linked to a surgical procedure.

Panel Review

Panelists noted that some patients may be at higher risk for developing a postoperative hemorrhage or hematoma. Specifically, they were concerned about patients with coagulopathies and those on anticoagulants. They suggested that where possible, this indicator be stratified for patients with underlying clotting differences. They also noted that patients admitted for trauma may be at a higher risk for developing postoperative hemorrhage or may have a hemorrhage diagnosed that occurred during the trauma. They also

suggested that this indicator be stratified for trauma and non-trauma patients.

Literature Review

Coding validity. The original CSP definition had a relatively high confirmation rate among major surgical cases (83% by coders' review, 57% by physicians' review, 52% by nurse-abstracted clinical documentation, and 76% if nurses also accepted physicians' notes as adequate documentation).^{73 74 75} Hartz and Kuhn estimated

⁷³ Lawthers A, McCarthy E, Davis R, Peterson L, Palmer R, Iezzoni L. Identification of in-hospital complications from claims data: Is it valid? *Med Care* 2000;38(8):785-795.

⁷⁴ McCarthy EP, Iezzoni LI, Davis RB, Palmer RH, Cahalane M, Hamel MB, et al. Does clinical evidence support ICD-9-CM diagnosis coding of complications? *Med Care* 2000;38(8):868-876.

⁷⁵ Weingart SN, Iezzoni LI, Davis RB, Palmer RH, Cahalane M, Hamel MB, et al. Use of administrative data to find substandard care: Validation of the Complications Screening Program. *Med Care*

the validity of hemorrhage codes using a gold standard based on transfusion “requirement.”⁷⁶ They identified only 26% of episodes of bleeding (defined as requiring return to surgery or transfusion of at least six units of blood products) by applying this indicator (9981) to Medicare patients who underwent coronary artery bypass surgery; the predictive value was 75%.

Construct Validity. Explicit process of care failures in the CSP validation study were relatively frequent among major surgical cases with CSP 24, but not among medical cases (66% and 13%, respectively), after excluding patients who had hemorrhage or hematoma at admission.⁷⁷ Cases flagged on this indicator and unflagged controls did not differ significantly on a composite of 17 generic process criteria. Similarly, cases flagged on this indicator and unflagged controls did not differ significantly on a composite of four specific process criteria for major surgical cases and two specific process criteria for medical cases in the earlier study of elderly Medicare beneficiaries.⁷⁸

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Postoperative Hemorrhage or Hematoma generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is lower than most indicators, at 8.6%, suggesting that observed differences in risk-adjusted rates may not reflect true differences across hospitals.

2000;38(8):796-806.

⁷⁷ Iezzoni LI, Davis RB, Palmer RH, Cahalane M, Hamel MB, Mukamal K, et al. Does the complications Screening Program flag case with process of care problems? Using explicit criteria to judge processes. *Int J Qual Health Care* 1999;11(2):107-18.

⁷⁸ Iezzoni L, Lawthers A, Petersen L, McCarthy E, Palmer R, Cahalane M, et al. Project to validate the Complications Screening Program: Health Care Financing Administration; 1998 March 31. Report No: HCFA Contract 500-94-0055.

The signal standard deviation for this indicator is lower than most indicators, at 0.00039, indicating that the systematic differences (signal) among hospitals is low and less likely associated with hospital characteristics. The signal share is lower than many indicators, at 0.00006. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Postoperative Hemorrhage or Hematoma is low, indicating that the measures are likely not biased based on the characteristics observed. (It is possible that characteristics that are not observed using administrative data may be related to the patient's risk of experiencing an adverse event.)

Source

This indicator was originally proposed by Iezzoni et al.⁷⁹ as part of the Complications Screening Program (CSP 24, “post-procedural hemorrhage or hematoma”), although their definition allowed either procedure or diagnosis codes. By contrast, the current definition requires a hemorrhage or hematoma diagnosis with an associated procedure to either control the hemorrhage or drain the hematoma. It was also included as one component of a broader indicator (“adverse events and iatrogenic complications”) in AHRQ's original HCUP Quality Indicators.⁸⁰

Postoperative Physiologic and Metabolic Derangement (PSI 10)

Definition	Cases of specified physiological or metabolic derangement per 1,000 elective surgical discharges with an operating room procedure. See page A-45.
Numerator	Discharges with ICD-9-CM codes for physiologic and metabolic derangements in any secondary diagnosis field. Discharges with acute renal failure (subgroup of physiologic and metabolic derangements) must be accompanied by a procedure code for dialysis (3995, 5498).
Denominator	All elective* surgical discharges defined by specific DRGs and an ICD-9-CM code for an operating room procedure. *Defined by admit type. Exclude patients with ICD-9-CM codes for physiologic and metabolic derangements in the principal diagnosis field, Exclude patients with acute renal failure where a procedure for dialysis occurs before or on the same day as the first operating room procedure. <i>Note: If day of procedure is not available in the input data file, the rate may be slightly lower than if the information was available.</i> Exclude patients with both a diagnosis code of ketoacidosis, hyperosmolarity, or other coma (subgroups of physiologic and metabolic derangements coding) and a principal diagnosis of diabetes. Exclude patients with both a secondary diagnosis code for acute renal failure (subgroup of physiologic and metabolic derangements coding) and a principal diagnosis of acute myocardial infarction, cardiac arrhythmia, cardiac arrest, shock, hemorrhage, or gastrointestinal hemorrhage. Exclude obstetrical patients in MDC 14.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 1.07 per 1,000 population at risk Bias: Some bias demonstrated
Risk Adjustment	Age, sex, DRG, comorbidity categories

Summary

This indicator is intended to flag cases of postoperative metabolic or physiologic complications. The population at risk is limited to elective surgical patients, because patients undergoing non-elective surgery may develop less preventable derangements. In addition, each diagnosis has specific exclusions, designed to reduce the number of flagged cases in which the diagnosis was present on admission or was more likely to be non-preventable.

Panel Review

Panelists expressed concern that acute renal failure suffers from the problem of varied definition: what one doctor may call acute renal

failure, another may not. To ensure that the only renal failure cases that are picked up are those that are clinically severe, the panel suggested that acute renal failure be included only when it is paired with a procedure code for dialysis.

Panelists noted that coding of relatively transient metabolic and physiologic complications may be lacking, such as in cases of diabetic ketoacidosis. Conversely, some physicians may capture non-clinically significant events in this indicator.

This indicator includes pediatric patients, which was not specifically discussed by the panel. The incidence of these complications is a function of the underlying prevalence of diabetes and renal

impairment, which are less common among children than among adults.

Literature Review

Coding validity. No evidence on validity is available from CSP studies. Geraci et al.⁸¹ confirmed only 5 of 15 episodes of acute renal failure and 12 of 34 episodes of hypoglycemia reported on discharge abstracts of VA patients hospitalized for CHF, COPD, or diabetes. Romano reported no false positives in episodes of acute renal failure or hypoglycemia using discharge abstracts of disectomy patients.⁸² ICD-9-CM diagnoses (585 or 7885) had a sensitivity of 8% and a predictive value of 4% in comparison with the VA's National Surgical Quality Improvement Program database, which defines renal failure as requiring dialysis within 30 days after surgery.⁸³

Construct Validity. After adjusting for patient demographic, geographic, and hospital characteristics, Hannan et al. reported that cases with a secondary diagnosis of fluid and electrolyte disorders were no more likely to have received care that departed from professionally recognized standards than cases without that code (2.2% versus 1.7%, OR=1.13).⁸⁴ However, these ICD-9-CM codes were omitted from the accepted AHRQ PSIs.

Empirical Evidence

The project team conducted extensive empirical analyses on the PSIs. Postoperative Physiologic and Metabolic Derangement generally performs well on several different dimensions, including

⁸¹ Geraci JM, Ashton CM, Kuykendall DH, Johnson ML, Wu L. International Classification of Diseases, 9th Revision, Clinical Modification codes in discharge abstracts are poor measures of complication occurrence in medical inpatients. *Med Care* 1997;35(6):589-602.

reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is lower than many indicators, at 20.9%, suggesting that observed differences in risk-adjusted rates may not reflect true differences across hospitals.

The signal standard deviation for this indicator is lower than many indicators, at 0.00054, indicating that the systematic differences (signal) among hospitals is low and less likely associated with hospital characteristics. The signal share is lower than many indicators, at 0.00033. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Postoperative Physiologic and Metabolic Derangement is moderate, indicating that the measures may or may not be substantially biased based on the characteristics observed. (It is possible that characteristics that are not observed using administrative data may or may not be related to the patient's risk of experiencing an adverse event.)

Source

This indicator was originally proposed by Iezzoni et al.⁸⁵ as part of the CSP (CSP 20, "postoperative physiologic and metabolic derangements"). The University HealthSystem Consortium adopted the CSP indicator for major surgery patients (#2945).

Postoperative Respiratory Failure (PSI 11)

Definition	Cases of acute respiratory failure per 1,000 elective surgical discharges with an operating room procedure. See page A-48.
Numerator	Discharges with ICD-9-CM codes for acute respiratory failure (518.81) in any secondary diagnosis field (After 1999, include 518.84).
Denominator	<p>All elective* surgical discharges defined by specific DRGs and an ICD-9-CM code for an operating room procedure. *Defined by admit type.</p> <p>Exclude patients with ICD-9-CM codes for acute respiratory failure in the principal diagnosis field,</p> <p>Exclude patients where a procedure for tracheostomy is the only operating room procedure.</p> <p>Exclude patients where a procedure for tracheostomy occurs before the first operating room procedure.</p> <p><i>Note: If day of procedure is not available in the input data file, the rate may be slightly lower than if the information was available.</i></p> <p>Exclude patients with respiratory or circulatory diseases (MDC 4 and MDC 5).</p> <p>Exclude obstetrical patients in MDC 14.</p>
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 4.29 per 1,000 population at risk Bias: Substantial bias; should be risk-adjusted
Risk Adjustment	Age, sex, DRG, comorbidity categories

Summary

This indicator is intended to flag cases of postoperative respiratory failure. This indicator limits the code for respiratory failure to secondary diagnosis codes to eliminate respiratory failure that was present on admission. It further excludes patients who have major respiratory or circulatory disorders and limits the population at risk to elective surgery patients.

Panel Review

Panelists rated the overall usefulness of this indicator as relatively favorable. They felt that only acute respiratory failure should be retained in this indicator and noted that this clinically significant event is at least partially preventable.

Literature Review

Coding Validity. CSP 3 had a relatively high confirmation rate among major surgical cases in the FY1994 Medicare inpatient claims files from California and Connecticut (72% by coders'

review, 75% by physicians' review).^{86 87} Nurse reviews were not performed.

Geraci et al. confirmed 1 of 2 episodes of respiratory failure reported on discharge abstracts of VA patients hospitalized for CHF or diabetes; the sensitivity for respiratory decompensation requiring mechanical ventilation was 25%.⁸⁸

Construct Validity. Explicit process of care failures in the CSP validation study were slightly

⁸⁶ Lawthers a, McCarthy E, Davis R, Peterson L, Palmer R, Iezzoni L. Identification of in-hospital complications from claims data: is it valid? Med Care 2000;38(8):785-795.

but not significantly more frequent among major surgical cases with CSP 3 than among unflagged controls (52% versus 46%).⁸⁹ Indeed, cases flagged on this indicator were significantly less likely than unflagged controls (24% versus 64%) to have at least one of four specific process-of-care problems in the earlier study of elderly Medicare beneficiaries.⁹⁰

Needleman and Buerhaus found that nurse staffing was independent of the occurrence of pulmonary failure among major surgery patients.⁹¹ However, Kovner and Gergen reported that having more registered nurse hours per adjusted patient day was associated with a lower rate of “pulmonary compromise” after major surgery.⁹²

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Postoperative Respiratory Failure generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is lower than many indicators, at 46.6%, suggesting that observed differences in risk-adjusted rates may not reflect true differences across hospitals. The signal standard deviation for this indicator is lower than many indicators, at 0.00230, indicating that the systematic differences (signal) among hospitals is low and less likely associated with hospital characteristics. The signal share is lower than many indicators, at 0.00187. The

signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Postoperative Respiratory Failure is high, indicating that the measures likely are biased based on the characteristics observed. (It is possible that characteristics that are not observed using administrative data may be related to the patient’s risk of experiencing an adverse event.) Risk adjustment is important for this indicator.

Source

This indicator was originally proposed by Iezzoni et al. as part of the CSP (CSP 3, “postoperative pulmonary compromise”).⁹³ Their definition also includes pulmonary congestion, other (or postoperative) pulmonary insufficiency, and acute pulmonary edema, which were omitted from this PSI. The University HealthSystem Consortium (#2927) and AHRQ’s original HCUP Quality Indicators adopted the CSP indicator for major surgery patients.⁹⁴ Needleman and Buerhaus identified postoperative pulmonary failure as an “Outcome Potentially Sensitive to Nursing,” using the original CSP definition.⁹⁵

Postoperative Pulmonary Embolism or Deep Vein Thrombosis (PSI 12)

Definition	Cases of deep vein thrombosis (DVT) or pulmonary embolism (PE) per 1,000 surgical discharges with an operating room procedure. See page A-48.
Numerator	Discharges with ICD-9-CM codes for deep vein thrombosis or pulmonary embolism in any secondary diagnosis field.
Denominator	<p>All surgical discharges defined by specific DRGs and an ICD-9-CM code for an operating room procedure.</p> <p>Exclude patients with ICD-9-CM codes for deep vein thrombosis or pulmonary embolism in the principal diagnosis field.</p> <p>Exclude patients where a procedure for interruption of vena cava is the only operating room procedure</p> <p>Exclude patients where a procedure for interruption of vena cava occurs before or on the same day as the first operating room procedure.</p> <p><i>Note: If day of procedure is not available in the input data file, the rate may be slightly lower than if the information was available.</i></p> <p>Exclude obstetrical patients in MDC 14.</p>
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 8.83 per 1,000 population at risk Bias: Substantial bias; should be risk-adjusted
Risk Adjustment	Age, sex, DRG, comorbidity categories

Summary

This indicator is intended to capture cases of postoperative venous thromboses and embolism—specifically, pulmonary embolism and deep venous thrombosis. This indicator limits vascular complications codes to secondary diagnosis codes to eliminate complications that were present on admission. It further excludes patients who have principal diagnosis of DVT, as these patients are likely to have had PE/DVT present on admission.

Panel Review

Panelists rated the overall usefulness of this indicator relatively highly as compared to other indicators. They noted that preventative techniques should decrease the rate of this indicator. This indicator includes pediatric patients. In the absence of specific thrombophilic disorders, postoperative thromboembolic complications in children are most likely to be secondary to venous catheters rather than venous stasis in the lower extremities.

Because the risk for DVT/PE varies greatly

according to the type of procedure performed, panelists suggested that this indicator be adjusted or stratified according to surgical procedure types.

Literature Review

Coding validity. Geraci et al. confirmed only 1 of 6 episodes of DVT or PE reported on discharge abstracts of VA patients for CHF, COPD, or diabetes; the sensitivity was 100%.⁹⁶ Among Medicare hip fracture patients, by contrast, Keeler et al. confirmed 88% of reported PE cases, and failed to ascertain just 6 cases (65% sensitivity) using ICD-9-CM codes.⁹⁷ For DVT, they found just 1 of 6 cases using ICD-9-CM codes (but no false positive codes). Other studies have demonstrated that ICD-9-CM codes for DVT and PE have high

⁹⁶ Geraci JM, Ashton CM, Kuykendall DH, Johnson ML, Wu L. In-hospital complications among survivors of admission for congestive heart failure, chronic obstructive pulmonary disease, or diabetes mellitus. *J Gen Intern Med* 1995;10(6):307-14.

⁹⁷ Keeler E, Kahn K, Bentow S. Assessing quality of care for hospitalized Medicare patients with hip fracture using coded diagnoses from the Medicare Provider Analysis and Review File. Springfield, VA: NTIS;1991.

predictive value when listed as the principal diagnosis for readmissions after major orthopedic surgery (100%) or after inferior vena cava filter placement (98%).⁹⁸ However, these findings do not directly address the validity of DVT/PE as a secondary diagnosis among patients treated by anticoagulation.

Construct validity. Explicit process of care failures in the CSP validation study were relatively frequent among both major surgical and medical cases with CSP 22 (72% and 69%, respectively), after disqualifying cases in which DVT/PE was actually present at admission.⁹⁹ Needleman and Buerhaus found that nurse staffing was independent of the occurrence of DVT/PE among both major surgical or medical patients.¹⁰⁰ However, Kovner and Gergen reported that having more registered nurse hours and non-RN hours was associated with a lower rate of DVT/PE after major surgery.¹⁰¹

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Postoperative PE or DVT generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is moderately high, relative to other indicators, at 72.6%, suggesting that observed differences in risk-adjusted rates likely reflect true differences across hospitals.

The signal standard deviation for this indicator is lower than many indicators, at 0.00633, indicating

that the systematic differences (signal) among hospitals is low and less likely associated with hospital characteristics. The signal share is lower than many indicators, at 0.00511. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Postoperative PE or DVT is high, indicating that the measures likely are biased based on the characteristics observed. (It is possible that characteristics that are not observed using administrative data may be related to the patient's risk of experiencing an adverse event.) Risk adjustment is important for this indicator.

Source

This indicator was originally proposed by Iezzoni et al. as part of the Complications Screening Program (CSP 22, “venous thrombosis and pulmonary embolism”)¹⁰² and was one of AHRQ's original HCUP Quality Indicators for major surgery and invasive vascular procedure patients.¹⁰³ A code that maps to this indicator in the final AHRQ PSI was proposed by Miller et al. as one component of a broader indicator (“iatrogenic conditions”).¹⁰⁴

Postoperative Sepsis (PSI 13)

Definition	Cases of sepsis per 1,000 elective surgery patients with an operating room procedure and a length of stay of 4 days or more. See page 51.
Numerator	Discharges with ICD-9-CM code for sepsis in any secondary diagnosis field.
Denominator	All elective* surgical discharges defined by specific DRGs and an ICD-9-CM code for an operating room procedure. *Defined by admit type. Exclude patients with ICD-9-CM codes for sepsis in the principal diagnosis field, Exclude patients with a principal diagnosis of infection, any code for immunocompromised state, or cancer. Include only patients with a length of stay of 4 days or more. Exclude obstetrical patients in MDC 14.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 11.80 per 1,000 population at risk Bias: Substantial bias; should be risk-adjusted
Risk Adjustment	Age, sex, DRG, comorbidity categories

Summary

This indicator is intended to flag cases of nosocomial postoperative sepsis. This indicator limits the code for sepsis to secondary diagnosis codes to eliminate sepsis that was present on admission. This indicator also excludes patients who have a principal diagnosis of infection, patients with a length of stay of less than 3 days, and patients with potential immunocompromised states (e.g., AIDS, cancer, transplant).

Panel Review

Panelists rated the overall usefulness of this indicator favorably, although they were less sure that this complication was reflective of medical error.

This indicator includes pediatric patients. High-risk neonates are at particularly high risk for catheter-related infections.

Literature Review

Coding validity. No evidence on validity is available from CSP studies. Barbour reported that only 38% of discharge abstracts with a diagnosis of sepsis actually had hospital-

acquired sepsis.¹⁰⁵ However, this review was not limited to cases with a secondary diagnosis of sepsis, and sensitivity could not be evaluated. Geraci et al. confirmed (by blood culture) only 2 of 15 episodes of sepsis or “other infection” reported on discharge abstracts of VA patients hospitalized for CHF, COPD, or diabetes; the sensitivity for a positive blood culture was 50%.¹⁰⁶ In comparison with the VA’s National Surgical Quality Improvement Program database, in which “systemic sepsis” is defined by a positive blood culture and systemic manifestations of sepsis within 30 days after surgery, the ICD-9-CM diagnosis had a sensitivity of 37% and a predictive value of 30%.¹⁰⁷

¹⁰⁷ Best W, Khuri S, Phelan M, Hur K, Henderson W, Demakis J, et al. Identifying patient preoperative risk factors and postoperative adverse events in administrative databases: Results from the Department of Veterans Affairs national Surgical Quality Improvement Program. *J Am Coll Surg* 2002;194(3):257-266.

Construct validity. Needleman and Buerhaus found that nurse staffing was independent of the occurrence of sepsis among both major surgical or medical patients.¹⁰⁸

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Postoperative Sepsis generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is lower than many indicators, at 53.9%, suggesting that observed differences in risk-adjusted rates may not reflect true differences across hospitals.

The signal standard deviation for this indicator is lower than many indicators, at 0.00869, indicating that the systematic differences (signal) among hospitals is low and less likely associated with hospital characteristics. The signal share is lower than many indicators, at 0.00790. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Postoperative Sepsis is high, indicating that the measures likely are biased based on the characteristics observed. (It is possible that characteristics that are not observed using administrative data may be related to the patient's risk of experiencing an

adverse event.) Risk adjustment is important for this indicator.

Source

This indicator was originally proposed by Iezzoni et al. as part of the Complications Screening Program (CSP 7, "septicemia").¹⁰⁹ Needleman and Buerhaus identified sepsis as an "Outcome Potentially Sensitive to Nursing" using the same CSP definition.¹¹⁰

Postoperative Wound Dehiscence, Provider Level (PSI 14)

Provider Level Definition

Definition	Cases of reclosure of postoperative disruption of abdominal wall per 1,000 cases of abdominopelvic surgery. See page A-51.
Numerator	Discharges with ICD-9-CM code for reclosure of postoperative disruption of abdominal wall (54.61) in any procedure field.
Denominator	All abdominopelvic surgical discharges. Exclude patients where a procedure for reclosure of postoperative disruption of abdominal wall occurs before or on the same day as the first abdominopelvic surgery procedure. <i>Note: If day of procedure is not available in the input data file, the rate may be slightly lower than if the information was available.</i> Exclude obstetrical patients in MDC 14.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 1.95 per 1,000 population at risk Bias: Some bias demonstrated
Risk Adjustment	Age, sex, DRG, comorbidity categories

Postoperative Wound Dehiscence, Area Level (PSI 24)

Area Level Definition

Definition	Cases of reclosure of postoperative disruption of abdominal wall per 100,000 population. See page A-51.
Numerator	Discharges with ICD-9-CM code for reclosure of postoperative disruption of abdominal wall (5461) in any procedure field. Exclude obstetrical patients in MDC 14.
Denominator	Population of county or MSA associated with FIPS code of patient's residence or hospital location.
Type of Indicator	Area level
Empirical Performance	Population Rate (2002): 2.35 per 100,000 population at risk
Risk Adjustment	No risk adjustment

Summary

This indicator is intended to flag cases of wound dehiscence in patients who have undergone abdominal and pelvic surgery. This indicator is defined both on a provider level (by including cases based on secondary diagnosis associated with the same hospitalization) and on an area level (by including all cases of wound dehiscence).

Panel Review

Panelists suggested that postoperative wound disruption be excluded from the indicator and that trauma, cancer, and immunocompromised patients

be included. They also reported that the risk of developing wound dehiscence varies with patient factors such as age and comorbidities.

Literature Review

Coding validity. No evidence on validity is available from CSP studies. Hawker et al. found that the sensitivity and predictive value of wound dehiscence were both 100%.¹¹¹ Faciszewski et al. aggregated

¹¹¹ Hawker BA, Coyte PC, Wright JG, Paul JE, Bombardier C. Accuracy of administrative data for assessing outcomes after knee replacement surgery. J Clin Epidemiol 1997;50(3):265-73.

wound dehiscence with postoperative hemorrhage or hematoma and reported a pooled confirmation rate of 17% with 3% sensitivity of coding among patients who underwent spinal fusion.¹¹² In comparison with the VA's National Surgical Quality Improvement Program database, in which dehiscence is defined as fascial disruption within 30 days after surgery, the ICD-9-CM diagnosis of wound disruption had a sensitivity of 25% and a predictive value of 23%.¹¹³ This code (9983) was ultimately removed from the accepted PSI, because the clinical panel was concerned that the diagnosis definition was too broad and failed to distinguish skin from fascial separation.

Construct validity. Based on two-stage review of randomly selected deaths, Hannan et al. reported that cases with a secondary diagnosis of wound disruption were 3.0 times more likely to have received care that departed from professionally recognized standards than cases without that code (4.3% versus 1.7%), after adjusting for patient demographic, geographic, and hospital characteristics.¹¹⁴

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Postoperative Wound Dehiscence generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is related to systematic differences (signal) in hospital performance rather than random variation (noise)—is low, at 35.6%, suggesting that observed differences in risk-adjusted rates may not reflect true differences across hospitals.

The signal standard deviation for this indicator is lower than many indicators, at 0.00188, indicating that the systematic differences (signal) among hospitals is low and less likely associated with

hospital characteristics. The signal share is lower than many indicators, at 0.00171. Signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Postoperative Wound Dehiscence is moderate, indicating that the measures may or may not be substantially biased based on the characteristics observed.

Source

An indicator on this topic (9983) was originally proposed by Hannan et al. to target “cases that would have a higher percentage of quality of care problems than cases without the criterion, as judged by medical record review.”¹¹⁵ The same code was included within a broader indicator (“adverse events and iatrogenic complications”) in AHRQ’s original HCUP Quality Indicators.¹¹⁶ Iezzoni et al. identified an associated procedure code for reclosure of an abdominal wall dehiscence (5461), and included both codes in the Complications Screening Program.¹¹⁷ Miller et al. suggested the use of both codes (as “wound disruption”) in the original “AHRQ PSI Algorithms and Groupings.”¹¹⁸

Accidental Puncture or Laceration, Provider Level (PSI 15)

Provider Level Definition (only secondary diagnosis)

Definition	Cases of technical difficulty (e.g., accidental cut or laceration during procedure) per 1,000 discharges. See page A-57.
Numerator	Discharges with ICD-9-CM code denoting technical difficulty (e.g., accidental cut, puncture, perforation, or laceration) in any secondary diagnosis field.
Denominator	All medical and surgical discharges defined by specific DRGs. Exclude patients with ICD-9-CM code denoting technical difficulty (e.g., accidental cut, puncture, perforation, or laceration) in the principal diagnosis field. Exclude obstetrical patients in MDC 14.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 3.472 per 1,000 population at risk Bias: Substantial bias; should be risk-adjusted
Risk Adjustment	Age, sex, DRG, comorbidity categories

Accidental Puncture or Laceration, Area Level (PSI 25)

Area Level Definition (principal or secondary diagnosis)

Definition	Cases of technical difficulty (e.g., accidental cut or laceration during procedure) per 100,000 population.
Numerator	Discharges with ICD-9-CM code denoting technical difficulty (e.g., accidental cut, puncture, perforation, or laceration) in any diagnosis field (principal or secondary) of all medical and surgical discharges defined by specific DRGs. Exclude obstetrical patients in MDC 14.
Denominator	Population of county or MSA associated with FIPS code of patient's residence or hospital location.
Type of Indicator	Area level
Empirical Performance	Population Rate (2002): 36.79 per 100,000 population at risk
Risk Adjustment	No risk adjustment

Summary

This indicator is intended to flag cases of complications that arise due to technical difficulties in medical care—specifically, those involving an accidental puncture or laceration.

Panel Review

Panelists were unsure about how the culture of quality improvement in a hospital would affect the coding of this complication. Some physicians may be reluctant to record the occurrence of this

complication for fear of punishment. Panelists also noted that some of these occurrences are not preventable.

Literature Review

Coding validity. No evidence on validity is available from CSP studies. A study of laparoscopic cholecystectomy found that 95% of patients with an ICD-9 code of accidental puncture or laceration had a confirmed injury to

the bile duct or gallbladder.¹¹⁹ However, only 27% had a clinically significant injury that required any intervention; sensitivity of reporting was not evaluated. A similar study of cholecystectomies reported that these two ICD-9 codes had a sensitivity of 40% and a predictive value of 23% in identifying bile duct injuries.¹²⁰ Among 185 total knee replacement patients, Hawker et al. found that the sensitivity and predictive value of codes describing “miscellaneous mishaps during or as a direct result of surgery” (definition not given) were 86% and 55%, respectively.¹²¹ Romano et al. identified 19 of 45 episodes of accidental puncture, laceration, or related procedure using discharge abstracts of diskectomy patients; there was one false positive.¹²²

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Accidental Puncture or Laceration generally performs well on several different dimensions, including reliability, bias, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is moderately high, relative to other indicators, at 82.9%, suggesting that observed differences in risk-adjusted rates most likely reflect true differences across hospitals.

The signal standard deviation for this indicator is lower than many indicators, at 0.00279, indicating that the systematic differences (signal) among hospitals is low and less likely associated with hospital characteristics. The signal share is lower than many indicators, at 0.00241. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other

potential factors (e.g., patient characteristics).

Minimum bias. The project team assessed the effect of age, gender, DRG, and comorbidity risk adjustment on the relative ranking of hospitals compared to no risk adjustment. They measured (1) the impact of adjustment on the assessment of relative hospital performance, (2) the relative importance of the adjustment, (3) the impact on hospitals with the highest and lowest rates, and (4) the impact throughout the distribution. The detected bias for Accidental Puncture or Laceration is high, indicating that the measures likely are biased based on the characteristics observed. (It is possible that characteristics that are not observed using administrative data may be related to the patient’s risk of experiencing an adverse event.) Risk adjustment is important for this indicator.

Source

This indicator was originally proposed by Iezzoni et al. as part of the Complications Screening Program, although unlike the final PSI, its codes were split between two CSP indicators (CSP 27, “technical difficulty with medical care,” and “sentinel events”).¹²³ It was also included as one component of a broader indicator (“adverse events and iatrogenic complications”) in AHRQ’s original HCUP Quality Indicators.¹²⁴ The University HealthSystem Consortium adopted CSP 27 as an indicator for medical (#2806) and major surgery (#2956) patients. Miller et al. also split this set of ICD-9-CM codes into two broader indicators (“miscellaneous misadventures” and “E codes”) in the original “AHRQ PSI Algorithms and Groupings.”¹²⁵ Based on expert consensus panels, McKesson Health Solutions included one component of this PSI (Accidental Puncture or Laceration) in its CareEnhance Resource Management Systems, Quality Profiler Complications Measures Module.

Transfusion Reaction, Provider Level (PSI 16)

Provider Level Definition (only secondary diagnosis)

Definition	Cases of transfusion reaction per 1,000 discharges. See page A-58.
Numerator	Discharges with ICD-9-CM code for transfusion reaction in any secondary diagnosis field.
Denominator	All medical and surgical discharges defined by specific DRGs. Exclude patients with ICD-9-CM code for transfusion reaction in the principal diagnosis field.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 0.005 per 1,000 population at risk Bias: Did not undergo empirical testing of bias
Risk Adjustment	No risk adjustment

Transfusion Reaction, Area Level (PSI 26)

Area Level Definition (principal or secondary diagnosis)

Definition	Cases of transfusion reaction per 100,000 population. See page A-58.
Numerator	Discharges with ICD-9-CM code for transfusion reaction in any diagnosis field (principal or secondary) of all medical and surgical discharges defined by specific DRGs.
Denominator	Population of county or MSA associated with FIPS code of patient's residence or hospital location.
Type of Indicator	Area level
Empirical Performance	Population Rate (2002): 0.06 per 100,000 population
Risk Adjustment	No risk adjustment

Summary

This indicator is intended to flag cases of major reactions due to transfusions (ABO and Rh). This indicator is defined both on a provider level (by including cases based on secondary diagnosis associated with the same hospitalization) and on an area level (by including all cases of transfusion reactions).

Panel Review

The overall usefulness of this indicator was rated as very favorable by panelists. This indicator includes only those events that result in additional medical care. Some minor reactions may be missed, although the panel suggested that these minor reactions are less clearly due to medical error than the Rh or ABO reactions included in the indicator.

Literature Review

The project team was unable to find evidence on validity from prior studies, most likely because this complication is quite rare.

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Given the low rates or occurrences for Transfusion Reaction, the project team did not measure reliability or minimum bias. The indicator could not be risk-adjusted due to the small number of numerator cases. Users of the PSI software should note the output will only contain observed rates for Transfusion Reaction.

Source

This indicator was originally proposed by Iezzoni et al. as part of the Complications Screening Program (CSP “sentinel events”).¹²⁶ It was also included as one component of a broader indicator (“adverse events and iatrogenic complications”) in AHRQ’s original HCUP Quality Indicators.¹²⁷ It was proposed by Miller et al. in the original “AHRQ PSI Algorithms and Groupings.”¹²⁸

Birth Trauma—Injury to Neonate (PSI 17)

Definition	Cases of birth trauma, injury to neonate, per 1,000 liveborn births. See page A-58.
Numerator	Discharges with ICD-9-CM code for birth trauma in any diagnosis field. Exclude infants with a subdural or cerebral hemorrhage (subgroup of birth trauma coding) and any diagnosis code of pre-term infant (denoting birth weight of less than 2,500 grams and less than 37 weeks gestation or 34 weeks gestation or less). Exclude infants with injury to skeleton (767.3, 767.4) and any diagnosis code of osteogenesis imperfecta (756.51).
Denominator	All liveborn births.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 6.59 per 1,000 population at risk Bias: Did not undergo empirical testing of bias
Risk Adjustment	Sex

Summary

This indicator is intended to flag cases of birth trauma for infants born alive in a hospital. The indicator excludes patients born pre-term, as birth trauma in these patients may be less preventable than for full-term infants.

Panel Review

The overall usefulness of this indicator was rated as favorable by panelists

Literature Review

Coding validity. A study of newborns that had a discharge diagnosis of birth trauma found that only 25% had sustained a significant injury to the head, neck, or shoulder.¹²⁹ The remaining patients either had superficial injuries or injuries inferior to the neck. The project team was unable to find other evidence on the validity of this indicator. Towner et al. linked California maternal and infant discharge abstracts from 1992 through 1994, but they used only infant discharge abstracts to describe the incidence of neonatal intracranial injury, and they did not

report the extent of agreement between the two data sets.¹³⁰

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Birth Trauma generally performs well on several different dimensions, including reliability, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is high, relative to other indicators, at 97.0%, suggesting that observed differences in risk-adjusted rates reflect true differences across hospitals.

The signal standard deviation for this indicator is also high, relative to other indicators, at 0.04128, indicating that the systematic differences (signal) among hospitals is high and more likely associated with hospital characteristics. The signal share is also high, relative to other indicators, at 0.13603. The signal share is a measure of the share of total variation (hospital

and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The bias for Birth Trauma was not measured, since adequate risk adjustment was not available.

Source

This indicator has been widely used in the obstetric community, although it is most commonly based on chart review rather than administrative data. It was proposed by Miller et al. in the original “AHRQ PSI Algorithms and Groupings.”¹³¹ Based on expert consensus panels, McKesson Health Solutions included a broader version of this indicator in its CareEnhance Resource Management Systems, Quality Profiler Complications Measures Module.

¹³¹ Miller M, Elixhauser A, Zhan C, Meyer G, Patient Safety Indicators: Using administrative data to identify potential patient safety concerns. Health Services Research 2001;36(6 Part II):110-132.

Obstetric Trauma—Vaginal Delivery with Instrument (PSI 18)

Definition	Cases of obstetric trauma (4 th degree lacerations, other obstetric lacerations) per 1,000 instrument-assisted vaginal deliveries. See page A-60.
Numerator	Discharges with ICD-9-CM code for obstetric trauma in any diagnosis or procedure field.
Denominator	All vaginal delivery discharges with any procedure code for instrument-assisted delivery.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 213.74 per 1,000 population at risk Bias: Did not undergo empirical testing of bias
Risk Adjustment	Age

Obstetric Trauma with 3rd Degree Lacerations—Vaginal Delivery with Instrument (PSI 27)

Definition	Cases of obstetric trauma (3 rd or 4 th degree lacerations, other obstetric lacerations) per 1,000 instrument-assisted vaginal deliveries. See page A-60.
Numerator	Discharges with ICD-9-CM code for obstetric trauma in any diagnosis or procedure field.
Denominator	All vaginal delivery discharges with any procedure code for instrument-assisted delivery.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 237.81 per 1,000 population at risk Bias: Did not undergo empirical testing of bias
Risk Adjustment	Age

Summary

This indicator is intended to flag cases of potentially preventable trauma during vaginal delivery with instrument.

Panel Review

The overall usefulness of an Obstetric trauma indicator was rated as favorable by panelists. After initial review, the indicator was eventually split into three separate Obstetric Trauma indicators: Vaginal Delivery with Instrument, Vaginal Delivery without Instrument, and Cesarean Delivery.

Literature Review

Coding validity. In a stratified probability sample of vaginal and Cesarean deliveries, the weighted sensitivity and predictive value of coding for third- and fourth-degree lacerations and vulvar/perineal hematomas (based on either diagnosis or procedure codes) were 89% and 90%, respectively.¹⁵⁸ The authors did not report coding validity for third- and fourth-degree lacerations separately. The project team was unable to find other evidence on validity from prior studies.

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Obstetric Trauma—Vaginal Delivery with Instrument generally performs well on several different dimensions, including reliability, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is moderately high, relative to other indicators, at 69.9%, suggesting that observed differences in risk-adjusted rates likely reflect true differences across hospitals.

The signal standard deviation for this indicator is also high, relative to other indicators, at 0.09794, indicating that the systematic differences (signal) among hospitals is high and more likely associated with hospital characteristics. The signal share is high, relative to other indicators, at 0.05539. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The bias for Obstetric Trauma—Vaginal Delivery with Instrument was not measured, since adequate risk adjustment was not available.

Source

An overlapping subset of this indicator (third- or fourth-degree perineal laceration) has been adopted by the Joint Commission for the Accreditation of Healthcare Organizations (JCAHO) as a core performance measure for “pregnancy and related conditions” (PR-25). Based on expert consensus panels, McKesson Health Solutions included the JCAHO indicator in its CareEnhance Resource Management Systems, Quality Profiler Complications Measures Module. Fourth Degree Laceration, one of the codes mapped to this PSI, was included as one component of a broader indicator (“obstetrical complications”) in AHRQ’s original HCUP Quality Indicators.¹³²

¹³² Johantgen M, Elixhauser A, Bali JK, Goldfarb M, Harris DR. Quality indicators using hospital discharge data: State and national applications. *Jt Comm J Qual Improv* 1998;24(2):88-195. Published erratum

Obstetric Trauma—Vaginal Delivery without Instrument (PSI 19)

Definition	Cases of obstetric trauma (4 th degree lacerations, other obstetric lacerations) per 1,000 vaginal deliveries without instrument assistance. See page A-61.
Numerator	Discharges with ICD-9-CM code for obstetric trauma in any diagnosis or procedure field per 1,000 vaginal deliveries without instrument assistance.
Denominator	All vaginal delivery discharges. Exclude instrument-assisted delivery.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 80.83 per 1,000 population at risk Bias: Did not undergo empirical testing of bias
Risk Adjustment	Age

Obstetric Trauma with 3rd Degree Lacerations—Vaginal Delivery without Instrument (PSI 28)

Definition	Cases of obstetric trauma (3 rd or 4 th degree lacerations, other obstetric lacerations) per 1,000 vaginal deliveries without instrument assistance. See page A-61.
Numerator	Discharges with ICD-9-CM code for obstetric trauma in any diagnosis or procedure field.
Denominator	All vaginal delivery discharges. Exclude instrument-assisted delivery.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 86.21 per 1,000 population at risk Bias: Did not undergo empirical testing of bias
Risk Adjustment	Age

Summary

This indicator is intended to flag cases of potentially preventable trauma during a vaginal delivery without instrument.

Panel Review

The overall usefulness of an Obstetric Trauma Indicator was rated as favorable by panelists. After initial review, the indicator was split into three separate Obstetric Trauma indicators: Vaginal Delivery with Instrument, Vaginal Delivery without Instrument, and Cesarean Delivery.

Literature Review

Coding validity. In a stratified probability sample of vaginal and Cesarean deliveries, the weighted sensitivity and predictive value of coding for third- and fourth-degree lacerations and vulvar/perineal hematomas (based on either diagnosis or procedure codes) were 89% and 90%, respectively.¹⁵⁸ The authors did not report coding validity for third- and fourth-degree lacerations separately. The project team was unable to find other evidence on validity from prior studies.

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Obstetric Trauma—Vaginal Delivery without Instrument generally performs well on several different dimensions, including reliability, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is high, relative to other indicators, at 86.4%, suggesting that observed differences in risk-adjusted rates reflect true differences across hospitals.

The signal standard deviation for this indicator is also high, relative to other indicators, at 0.04314, indicating that the systematic differences (signal) among hospitals is high and more likely associated with hospital characteristics. The signal share is lower than many other indicators, at 0.02470. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The bias for Obstetric Trauma—Vaginal Delivery without Instrument was not measured, since adequate risk adjustment was not available.

Based on expert consensus panels, McKesson Health Solutions included the JCAHO indicator in its CareEnhance Resource Management Systems, Quality Profiler Complications Measures Module. Fourth-Degree Laceration, one of the codes mapped to this PSI, was included as one component of a broader indicator (“obstetrical complications”) in AHRQ’s original HCUP Quality Indicators.¹³³

Obstetric Trauma—Cesarean Delivery (PSI 20)

Definition	Cases of obstetric trauma (4 th degree lacerations, other obstetric lacerations) per 1,000 Cesarean deliveries. See page A-62.
Numerator	Discharges with ICD-9-CM code for obstetric trauma in any diagnosis or procedure field per 1,000 Cesarean deliveries.
Denominator	All Cesarean delivery discharges.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 5.43 per 1,000 population at risk Bias: Did not undergo empirical testing of bias
Risk Adjustment	Age

Obstetric Trauma with 3rd Degree Lacerations—Cesarean Delivery (PSI 29)

Definition	Cases of obstetric trauma (3 rd or 4 th degree lacerations, other obstetric lacerations) per 1,000 Cesarean deliveries. See page A-62.
Numerator	Discharges with ICD-9-CM code for obstetric trauma in any diagnosis or procedure field.
Denominator	All Cesarean delivery discharges.
Type of Indicator	Provider level
Empirical Performance	Population Rate (2002): 5.61 per 1,000 population at risk Bias: Did not undergo empirical testing of bias
Risk Adjustment	Age

Summary

This indicator is intended to flag cases of potentially preventable trauma during Cesarean delivery.

Panel Review

The overall usefulness of an Obstetric Trauma Indicator was rated as favorable by panelists. After initial review, the indicator was eventually split into three separate Obstetric Trauma indicators: Vaginal Delivery with Instrument, Vaginal Delivery without Instrument, and Cesarean Delivery.

Literature Review

Coding validity. In a stratified probability sample of vaginal and Cesarean deliveries, the weighted sensitivity and predictive value of coding for third- and fourth-degree lacerations and

vulvar/perineal hematomas (based on either diagnosis or procedure codes) were 89% and 90%, respectively.¹⁵⁸ The authors did not report coding validity for third- and fourth-degree lacerations separately. The project team was unable to find other evidence on validity from prior studies.

Empirical Analysis

The project team conducted extensive empirical analyses on the PSIs. Obstetric Trauma—Cesarean Delivery generally performs well on several different dimensions, including reliability, relatedness of indicators, and persistence over time.

Reliability. The signal ratio—measured by the proportion of the total variation across hospitals that is truly related to systematic differences (signal) in hospital performance rather than random variation (noise)—is lower than many

indicators, at 45.9%, suggesting that observed differences in risk-adjusted rates may not reflect true differences across hospitals.

The signal standard deviation for this indicator is also lower than many indicators, at 0.00590, indicating that the systematic differences (signal) among hospitals is low and less likely associated with hospital characteristics. The signal share is lower than many indicators, at 0.00576. The signal share is a measure of the share of total variation (hospital and patient) accounted for by hospitals. The lower the share, the less important the hospital in accounting for the rate and the more important other potential factors (e.g., patient characteristics).

Minimum bias. The bias for Obstetric Trauma—Cesarean Delivery was not measured, since adequate risk adjustment was not available.

Source

An overlapping subset of this indicator (third- or fourth-degree perineal laceration) has been adopted by the Joint Commission for the Accreditation of Healthcare Organizations (JCAHO) as a core performance measure for “pregnancy and related conditions” (PR-25). Based on expert consensus panels, McKesson Health Solutions included the JCAHO indicator in its CareEnhance Resource Management Systems, Quality Profiler Complications Measures Module. Fourth Degree Laceration, one of the codes mapped to this PSI, was included as one component of a broader indicator (“obstetrical complications”) in AHRQ’s original HCUP Quality Indicators.¹³⁴

Appendix A: Patient Safety Indicators – Detailed Definitions

For ICD-9-CM codes introduced after October 1995, the date of introduction is indicated after the code label, e.g., OCT 04.

Complications of Anesthesia (PSI 1)

Numerator:

Discharges with ICD-9-CM diagnosis codes for anesthesia complications in any secondary diagnosis field.

ICD-9-CM Anesthesia Complications diagnosis codes:

Adverse effects in therapeutic use, other central nervous system depressants and anesthetics:

E8763 ENDOTRACHEAL TUBE WRONGLY PLACE DURING ANESTHETIC PROCEDURE

E9381 HALOTHANE
 E9382 OTHER GASEOUS ANESTHETICS
 E9383 INTRAVENOUS ANESTHETICS
 E9384 OTHER AND UNSPECIFIED GENERAL ANESTHETICS
 E9385 SURFACE AND INFILTRATION ANESTHETICS
 E9386 PERIPHERAL NERVE AND PLEXUS BLOCKING ANESTHETICS
 E9387 SPINAL ANESTHETICS
 E9389 OTHER AND UNSPECIFIED LOCAL ANESTHETICS

Poisoning by other central nervous system depressants and anesthetics:

9681 HALOTHANE
 9682 OTHER GASEOUS ANESTHETICS
 9683 INTRAVENOUS ANESTHETICS
 9684 OTHER AND UNSPECIFIED GENERAL ANESTHETICS
 9687 SPINAL ANESTHETICS
 E8551 ACCIDENTAL POISONING, OTHER NERVOUS SYSTEM DEPRESSANTS

Denominator:

All surgical discharges defined by specific DRGs and an ICD-9-CM code for an operating room procedure (Appendix C).

Surgical Discharge DRGs:

001 CRANIOTOMY, AGE > 17 W/ CC
 002 CRANIOTOMY AGE > 17 W/O CC
 003 CRANIOTOMY, AGE 0-17
 004* SPINAL PROCEDURES
 005* EXTRACRANIAL VASCULAR PROCEDURES
 006 CARPAL TUNNEL RELEASE
 007 PERIPHERAL AND CRANIAL NERVE AND OTHER NERVOUS SYSTEM PROCEDURES W/ CC
 008 PERIPHERAL AND CRANIAL NERVE AND OTHER NERVOUS SYSTEM PROCEDURES W/O CC
 036 RETINAL PROCEDURES
 037 ORBITAL PROCEDURES
 038 PRIMARY IRIS PROCEDURES
 039 LENS PROCEDURES W/ OR W/O VITRECTOMY
 040 EXTRAOCULAR PROCEDURES EXCEPT ORBIT, AGE GREATER THAN 17
 041 EXTRAOCULAR PROCEDURES EXCEPT ORBIT, AGE 0-17

Complications of Anesthesia (PSI 1)

042	INTRAOCULAR PROCEDURES EXCEPT RETINA, IRIS AND LENS
049	MAJOR HEAD AND NECK PROCEDURES
050	SIALOADENECTOMY
051	SALIVARY GLAND PROCEDURES EXCEPT SIALOADENECTOMY
052	CLEFT LIP AND PALATE REPAIR
053	SINUS AND MASTOID PROCEDURES, AGE GREATER THAN 17
054	SINUS AND MASTOID PROCEDURES, AGE 0-17
055	MISCELLANEOUS EAR, NOSE, MOUTH AND THROAT PROCEDURES
056	RHINOPLASTY
057	TONSILLECTOMY AND ADENOIDECTOMY PROCEDURES EXCEPT TONSILLECTOMY AND/OR ADENOIDECTOMY ONLY, AGE GREATER THAN 17
058	TONSILLECTOMY AND ADENOIDECTOMY PROCEDURES EXCEPT TONSILLECTOMY AND/OR ADENOIDECTOMY ONLY, AGE 0-17
059	TONSILLECTOMY AND/OR ADENOIDECTOMY ONLY, AGE GREATER THAN 17
060	TONSILLECTOMY AND/OR ADENOIDECTOMY ONLY, AGE 0 – 17
061	MYRINGOTOMY W/ TUBE INSERTION, AGE GREATER THAN 17
062	MYRINGOTOMY W/ TUBE INSERTION, AGE 0-17

ICD-9-CM Self-Inflicted Injury diagnosis codes:

Suicide and self-inflicted poisoning by solid or liquid substance:

E9500 ANALGESICS, ANTIPYRETICS, AND ANTIRHEUMATICS
E9501 BARBITURATES
E9502 OTHER SEDATIVE AND HYPNOTICS
E9503 TRANQUILIZERS AND OTHER PSYCHOTROPIC AGENTS
E9504 OTHER SPECIFIED DRUGS AND MEDICINAL SUBSTANCES
E9505 UNSPECIFIED DRUG OR MEDICINAL SUBSTANCE
E9506 AGRICULTURAL AND HORTICULTURAL CHEMICAL AND PHARMACEUTICAL PREPARATIONS
OTHER THAN PLANT FOODS AND FERTILIZERS
E9507 CORROSIVE AND CAUSTIC SUBSTANCES
E9508 ARSENIC AND ITS COMPOUNDS
E9509 OTHER AND UNSPECIFIED SOLID AND LIQUID SUBSTANCES

Suicide and self-inflicted poisoning by gases in domestic use:

E9510 GAS DISTRIBUTED BY PIPELINE
E9511 LIQUEFIED PETROLEUM GAS DISTRIBUTED IN MOBILE CONTAINERS
E9518 OTHER UTILITY GASES

Suicide and self-inflicted poisoning by other gases and vapors:

E9520 MOTOR VEHICLE EXHAUST GAS
E9521 OTHER CARBON MONOXIDE
E9528 OTHER SPECIFIED GASES AND VAPORS
E9529 UNSPECIFIED GASES AND VAPORS

Suicide and self-inflicted injury by hanging, strangulation, and suffocation:

E9530 HANGING

Complications of Anesthesia (PSI 1)

E9531 SUFFOCATION BY PLASTIC BAG
E9538 OTHER SPECIFIED MEANS
E954 SUICIDE AND SELF-INFLICTED INJURY BY SUBMERSION [DROWNING]

Suicide and self-inflicted injury by firearms and explosives:

E9550 HANDGUN
E9551 SHOTGUN
E9552 HUNTING RIFLE
E9553 MILITARY FIREARMS
E9554 OTHER AND UNSPECIFIED FIREARMS
E9555 EXPLOSIVES
E9559 UNSPECIFIED
E956 SUICIDE AND SELF INFLICTED INJURY BY CUTTING AND PIERCING INSTRUMENT

Suicide and self-inflicted injury by jumping from a high place:

E9570 RESIDENTIAL PREMISES
E9571 OTHER MAN-MADE STRUCTURES
E9572 NATURAL SITES
E9579 UNSPECIFIED

Suicide and self-inflicted injury by other and unspecified means:

E9580 JUMPING OR LYING BEFORE MOVING OBJECT
E9581 BURNS, FIRE
E9582 SCALD
E9583 EXTREMES OF COLD
E9584 ELECTROCUTION
E9585 CRASHING OF MOTOR VEHICLE
E9586 CRASHING OF AIRCRAFT
E9587 CAUSTIC SUBSTANCES EXCEPT POISONING
E9588 OTHER SPECIFIED MEANS
E9589 UNSPECIFIED MEANS

Death in Low-Mortality DRGs (PSI 2)

Numerator:

Discharges with disposition of "deceased".

Denominator:

Discharges in DRGs with less than 0.5% mortality rate, based on NIS 1997 low-mortality DRG. If a DRG is divided into "without/with complications," both DRGs must have mortality rates below 0.5% to qualify for inclusion.

Low-Mortality DRGs:

Adult Medical:

015 TRANSIENT ISCHEMIC ATTACK AND PRECEREBRAL OCCLUSIONS
021 VIRAL MENINGITIS
044 ACUTE MAJOR EYE INFECTIONS
045 NEUROLOGICAL EYE DISORDERS

Death in Low-Mortality DRGs (PSI 2)

065 DYSEQUILIBRIUM
068 OTITIS MEDIA AND URI, AGE GREATER THAN 17 W/ CC
071 LARYNGOTRACHEITIS
096 BRONCHITIS AND ASTHMA, AGE GREATER THAN 17 W/ CC
097 BRONCHITIS AND ASTHMA, AGE GREATER THAN 17 W/O CC

125 CIRCULATORY DISORDERS EXCEPT ACUTE MYOCARDIAL INFARCTION W/ CARDIAC
CATHETERIZATION W/O COMPLEX DIAGNOSIS
134 HYPERTENSION
140 ANGINA PECTORIS
141 SYNCOPE AND COLLAPSE W/ CC
142 SYNCOPE AND COLLAPSE W/O CC
143 CHEST PAIN
243 MEDICAL BACK PROBLEMS
246 NONSPECIFIC ARTHROPATHIES
295 DIABETES, AGE 0-35
317 ADMISSION FOR RENAL DIALYSIS
323 URINARY STONES W/ CC AND/OR ESW LITHOTRIPSY
324 URINARY STONES W/O CC
351 STERILIZATION, MALE
369 MENSTRUAL AND OTHER FEMALE REPRODUCTIVE SYSTEM DISORDERS
421 VIRAL ILLNESS, AGE GREATER THAN 17

Pediatric Medical:

026 SEIZURE AND HEADACHE, AGE 0-17
070 OTITIS MEDIA AND URI, AGE 0-17
074 OTHER EAR, NOSE, MOUTH AND THROAT DIAGNOSES, AGE 0-17
091 SIMPLE PNEUMONIA AND PLEURISY, AGE 0-17
098 BRONCHITIS AND ASTHMA, AGE 0-17
184 ESOPHAGITIS, GASTROENTERITIS AND MISCELLANEOUS DIGESTIVE DISORDERS, AGE 0-17
190 OTHER DIGESTIVE SYSTEM DIAGNOSES, AGE 0-17
252 FRACTURES, SPRAINS, STRAINS AND DISLOCATIONS OF FOREARM, HAND AND FOOT, AGE 0-17
255 FRACTURES, SPRAINS, STRAINS AND DISLOCATIONS OF UPPER ARM AND LOWER LEG EXCEPT
FOOT, AGE 0-17
279 CELLULITIS, AGE 0-17
282 TRAUMA TO SKIN, SUBCUTANEOUS TISSUE AND BREAST, AGE 0-17
298 NUTRITIONAL AND MISCELLANEOUS METABOLIC DISORDERS, AGE GREATER THAN 17 W/O CC
322 KIDNEY AND URINARY TRACT INFECTION, AGE 0-17
333 OTHER KIDNEY AND URINARY TRACT DIAGNOSES, AGE 0-17
396 RED BLOOD CELL DISORDERS, AGE 0-17
422 VIRAL ILLNESS AND FEVER OF UNKNOWN ORIGIN, AGE 0-17
448 ALLERGIC REACTIONS, AGE 0-17
451 POISONING AND TOXIC EFFECTS OF DRUGS, AGE 0-17

Adult Surgical:

036 RETINAL PROCEDURES
037 ORBITAL PROCEDURES
042 INTRAOCULAR PROCEDURES
050 SIALOADENECTOMY
052 CLEFT LIP AND PALATE REPAIR
053 SINUS AND MASTOID PROCEDURES, AGE GREATER THAN 17
055 MISCELLANEOUS EAR, NOSE, MOUTH AND THROAT PROCEDURES
057 TONSILLECTOMY AND ADENOIDECTOMY PROCEDURES EXCEPT TONSILLECTOMY AND/OR
ADENOIDECTOMY ONLY, AGE GREATER THAN 17
063 OTHER EAR, NOSE, MOUTH AND THROAT OR PROCEDURES
166 APPENDECTOMY W/O COMPLICATED PRINCIPAL DIAGNOSIS W/ CC

ICD-9-CM Cancer diagnosis codes (includes 4th and 5th digits):

140	MALIGNANT NEOPLASM OF LIP
141	MALIGNANT NEOPLASM OF TONGUE
142	MALIGNANT NEOPLASM OF MAJOR SALIVARY GLANDS
143	MALIGNANT NEOPLASM OF GUM
144	MALIGNANT NEOPLASM OF FLOOR OF MOUTH
145	MALIGNANT NEOPLASM OF OTHER AND UNSPECIFIED PARTS OF MOUTH
146	MALIGNANT NEOPLASM OF OROPHARYNX
147	MALIGNANT NEOPLASM OF NASOPHARYNX
148	MALIGNANT NEOPLASM OF HYPOPHARYNX
149	MALIGNANT NEOPLASM OF OTHER AND ILL-DEFINED SITES WITHIN THE LIP, ORAL CAVITY, AND PHARYNX
150	MALIGNANT NEOPLASM OF ESOPHAGUS
151	MALIGNANT NEOPLASM OF STOMACH
152	MALIGNANT NEOPLASM OF SMALL INTESTINE, INCLUDING DUODENUM
153	MALIGNANT NEOPLASM OF COLON
154	MALIGNANT NEOPLASM OF RECTUM, RECTOSIGMOID JUNCTION, AND ANUS
155	MALIGNANT NEOPLASM OF LIVER AND INTRAHEPATIC BILE DUCTS
156	MALIGNANT NEOPLASM OF GALLBLADDER AND EXTRAHEPATIC BILE DUCTS
157	MALIGNANT NEOPLASM OF PANCREAS
158	MALIGNANT NEOPLASM OF RETROPERITONEUM AND PERITONEUM
159	MALIGNANT NEOPLASM OF OTHER AND ILL-DEFINED SITES WITHIN THE DIGESTIVE ORGANS AND PERITONEUM
160	MALIGNANT NEOPLASM OF NASAL CAVITIES, MIDDLE EAR, AND ACCESSORY SINUSES
161	MALIGNANT NEOPLASM OF LARYNX
162	MALIGNANT NEOPLASM OF TRACHEA, BRONCHUS, AND LUNG
163	MALIGNANT NEOPLASM OF PLEURA
164	MALIGNANT NEOPLASM OF THYMUS, HEART, AND MEDIASTINUM
165	MALIGNANT NEOPLASM OF OTHER AND ILL-DEFINED SITES WITHIN THE RESPIRATORY SYSTEM AND INTRATHORACIC ORGANS
170	MALIGNANT NEOPLASM OF BONE AND ARTICULAR CARTILAGE
171	MALIGNANT NEOPLASM OF CONNECTIVE AND OTHER SOFT TISSUE
172	MALIGNANT MELANOMA OF SKIN
174	MALIGNANT NEOPLASM OF FEMALE BREAST
175	MALIGNANT NEOPLASM OF MALE BREAST
176	KARPOSI'S SARCOMA
179	MALIGNANT NEOPLASM OF UTERUS, PART UNSPECIFIED
180	MALIGNANT NEOPLASM OF CERVIX UTERI
181	MALIGNANT NEOPLASM OF PLACENTA
182	MALIGNANT NEOPLASM OF BODY OF UTERUS
183	MALIGNANT NEOPLASM OF OVARY AND OTHER UTERINE ADNEXA
184	MALIGNANT NEOPLASM OF OTHER AND UNSPECIFIED FEMALE GENITAL ORGANS
185	MALIGNANT NEOPLASM OF PROSTATE
186	MALIGNANT NEOPLASM OF TESTES
187	MALIGNANT NEOPLASM OF PENIS AND OTHER MALE GENITAL ORGANS
188	MALIGNANT NEOPLASM OF BLADDER
189	MALIGNANT NEOPLASM OF KIDNEY AND OTHER AND UNSPECIFIED URINARY ORGANS
190	MALIGNANT NEOPLASM OF EYE
191	MALIGNANT NEOPLASM OF BRAIN

Death in Low-Mortality DRGs (PSI 2)

192	MALIGNANT NEOPLASM OF OTHER AND UNSPECIFIED PARTS OF NERVOUS SYSTEM
193	MALIGNANT NEOPLASM OF THYROID GLAND
194	MALIGNANT NEOPLASM OF OTHER ENDOCRINE GLANDS AND RELATED STRUCTURES
195	MALIGNANT NEOPLASM OF OTHER, AND ILL-DEFINED SITES
196	SECONDARY AND UNSPECIFIED MALIGNANT NEOPLASM OF LYMPH NODES
197	SECONDARY MALIGNANT NEOPLASM OF RESPIRATORY AND DIGESTIVE SYSTEMS
198	SECONDARY MALIGNANT NEOPLASM OF OTHER SPECIFIED SITES
199	MALIGNANT NEOPLASM W/O SPECIFICATION OF SITE
200	LYMPHOSARCOMA AND RETICULOSARCOMA
201	HODGKIN'S DISEASE
202	OTHER MALIGNANT NEOPLASMS OF LYMPHOID AND HISTIOCYTIC TISSUES
203	MULTIPLE MYELOMA AND IMMUNOPROLIFERATIVE NEOPLASMS
204	LYMPHOID LEUKEMIA
205	MYELOID LEUKEMIA

524 TRANSIENT ISCHEMIA

* No longer valid in FY2005

Include only patients with a length of stay of 5 or more days.

Exclude:

Patients with ICD-9-CM code of decubitus ulcer in the principal diagnosis field.

Patients in MDC 9 (Skin, Subcutaneous Tissue, and Breast) or MDC 14 (Pregnancy, Childbirth and the Puerperium)

Patients with any diagnosis of hemiplegia, paraplegia, or quadriplegia.

Patients admitted from a long-term care facility.

ICD-9-CM Hemiplegia, Paraplegia, or Quadriplegia diagnosis codes (includes 4th and 5th digits):

3420 FLACCID HEMIPLEGIA
3421 SPASTIC HEMIPLEGIA
3428 OTHER SPECIFIED HEMIPLEGIA
3429 HEMIPLEGIA, UNSPECIFIED
3430 INFANTILE CEREBRAL PALSY, DIPLEGIC
3431 INFANTILE CEREBRAL PALSY, HEMIPLEGIC
3432 INFANTILE CEREBRAL PALSY, QUADRIPLÉGIC
3433 INFANTILE CEREBRAL PALSY, MONOPLÉGIC
3434 INFANTILE CEREBRAL PALSY INFANTILE HEMIPLEGIA
3438 INFANTILE CEREBRAL PALSY OTHER SPECIFIED INFANTILE CEREBRAL PALSY
3439 INFANTILE CEREBRAL PALSY, INFANTILE CEREBRAL PALSY, UNSPECIFIED
3440 QUADRIPLÉGIA AND QUADRIPLÉRESIS
3441 PARAPLEGIA
3442 DIPLEGIA OF UPPER LIMBS

Decubitus Ulcer (PSI 3)

3443 MONOPLÉGIA OF LOWER LIMB
3444 MONOPLÉGIA OF UPPER LIMB
3445 UNSPECIFIED MONOPLÉGIA
3446 CAUDA EQUINA SYNDROME
3448 OTHER SPECIFIED PARALYTIC SYNDROMES
3449 PARALYSIS, UNSPECIFIED
4382 HEMIPLEGIA/HEMIPARESIS
4383 MONOPLÉGIA OF UPPER LIMB
4384 MONOPLÉGIA OF LOWER LIMB
4385 OTHER PARALYTIC SYNDROME

Long-Term Care Facility

Admission source is recorded as long-term care facility (ASource=3)

Failure to Rescue (PSI 4)

Numerator:

All discharges with a disposition of "deceased".

Denominator:

Discharges with potential complications of care listed in failure to rescue (FTR) definition (e.g., pneumonia, DVT/PE, sepsis, acute renal failure, shock/cardiac arrest, or GI hemorrhage/acute ulcer).

NOTE: Exclusion criteria is specific to each diagnosis.

FTR 1 - Acute renal failure

ICD-9-CM Acute Renal Failure diagnosis codes (includes 4th and 5th digits):

5845 W/ LESION OF TUBULAR NECROSIS
5846 W/ LESION OF RENAL CORTICAL NECROSIS
5847 W/ LESION OF RENAL MEDULLARY NECROSIS
5848 W/ OTHER SPECIFIED PATHOLOGICAL LESION
5849 ACUTE RENAL FAILURE, UNSPECIFIED
6393 COMPLICATIONS FOLLOWING ABORTION AND ECTOPIC AND MOLAR PREGNANCIES, RENAL FAILURE
66930 ACUTE RENAL FAILURE FOLLOWING LABOR AND DELIVERY, UNSPECIFIED AS TO EPISODE OF CARE OR NOT APPLICABLE
66932 ACUTE RENAL FAILURE FOLLOWING LABOR AND DELIVERY, DELIVERED, W/ MENTION OF POSTPARTUM COMPLICATION
66934 ACUTE RENAL FAILURE FOLLOWING LABOR AND DELIVERY, POSTPARTUM CONDITION OR COMPLICATION

Exclude:

Principal diagnosis of acute renal failure, abortion-related renal failure, acute myocardial infarction, cardiac arrest, cardiac arrhythmia, hemorrhage, GI hemorrhage, shock, or trauma.

ICD-9-CM Abortion-related Renal Failure diagnosis codes:

63430 SPONTANEOUS ABORTION W/ RENAL FAILURE - UNSPECIFIED
63431 SPONTANEOUS ABORTION W/ RENAL FAILURE - INCOMPLETE
63432 SPONTANEOUS ABORTION W/ RENAL FAILURE - COMPLETE

Failure to Rescue (PSI 4)

63530 LEGAL ABORTION W/ RENAL FAILURE - UNSPECIFIED
63531 LEGAL ABORTION W/ RENAL FAILURE - INCOMPLETE

4831 PNEUMONIA DUE TO CHLAMYDIA
4838 PNEUMONIA DUE TO OTHER SPECIFIED ORGANISM
4841 PNEUMONIA IN CYTOMEGALIC INCLUSION DISEASE
4843 PNEUMONIA IN WHOOPING COUGH
4845 PNEUMONIA IN ANTHRAX
4846 PNEUMONIA IN ASPERGILLOSIS
4847 PNEUMONIA IN OTHER SYSTEMIC MYCOSES
4848 PNEUMONIA IN INFECTIOUS DISEASE NOT ELSEWHERE CLASSIFIED
4870 INFLUENZA W/ PNEUMONIA
4871 FLU W/ RESPIRATORY MANIFEST NOT ELSEWHERE CLASSIFIED
4878 FLU W/ MANIFESTATION NOT ELSEWHERE CLASSIFIED

ICD-9-CM Immunocompromised States diagnosis codes:

See PSI 2 **Death in Low Mortality DRGs** for a list of immunocompromised state diagnosis and procedure codes.

MDC 4 DISEASES AND DISORDERS OF THE RESPIRATORY SYSTEM

FTR 4 - Sepsis

Include ICD-9-CM Sepsis diagnosis codes:

0380 STREPTOCOCCAL SEPTICEMIA
0381 STAPHYLOCOCCAL SEPTICEMIA
03810 STAPHYLOCOCCAL SEPTICEMIA, UNSPECIFIED
03811 STAPHYLOCOCCUS AUREUS SEPTICEMIA
03819 OTHER STAPHYLOCOCCAL SEPTICEMIA
03840 SEPTICEMIA DUE TO GRAM NEGATIVE ORGANISM, UNSPECIFIED
0382 PNEUMOCOCCAL SEPTICEMIA [STREPTOCOCCUS PNEUMONIAE SEPTICEMIA]
0383 SEPTICEMIA DUE TO ANAEROBES
03841 SEPTICEMIA DUE TO OTHER GRAM-NEGATIVE ORGANISMS, HEMOPHILUS INFLUENZAE [H. INFLUENZAE]
03842 SEPTICEMIA DUE TO OTHER GRAM-NEGATIVE ORGANISMS, ESCHERICHIA COLI [E COLI]
03843 SEPTICEMIA DUE TO OTHER GRAM-NEGATIVE ORGANISMS, PSEUDOMONAS
03844 SEPTICEMIA DUE TO OTHER GRAM-NEGATIVE ORGANISMS, SERRATIA
03849 SEPTICEMIA DUE TO OTHER GRAM-NEGATIVE ORGANISMS, OTHER
0388 OTHER SPECIFIED SEPTICEMIAS
0389 UNSPECIFIED SEPTICEMIA
7907 BACTEREMIA
99591 SYSTEMIC INFLAMMATORY RESPONSE SYNDROME DUE TO INFECTIOUS PROCESS W/O ORGAN DYSFUNCTION
99592 SYSTEMIC INFLAMMATORY RESPONSE SYNDROME DUE TO INFECTION PROCESS W/ ORGAN DYSFUNCTION

Failure to Rescue (PSI 4)

Exclude:

Any diagnosis of immunocompromised state and principal diagnosis of infection or sepsis and patients with a length of stay 3 days or less¹³⁵.

ICD-9-CM Immunocompromised States diagnosis codes:

See PSI 2 **Death in Low Mortality DRGs** for a list of immunocompromised state diagnosis and procedure codes.

ICD-9-CM Infection diagnosis codes:

5400	ACUTE APPENDICITIS W/ GENERALIZED PERITONITIS
5401	ACUTE APPENDICITIS W/ PERITONEAL ABSCESS
5409	ACUTE APPENDICITIS W/O MENTION OF PERITONITIS
541	APPENDICITIS, UNQUALIFIED
542	OTHER APPENDICITIS
56201	DIVERTICULITIS OF SMALL INTESTINE (W/O MENTION OF HEMORRHAGE)
56203	DIVERTICULITIS OF SMALL INTESTINE W/ HEMORRHAGE
56211	DIVERTICULITIS OF COLON (W/O MENTION OF HEMORRHAGE)
56213	DIVERTICULITIS OF COLON W/ HEMORRHAGE
566	ABSCESS OF ANAL AND RECTAL REGIONS

416 SEPTICEMIA, AGE GREATER THAN 17
417 SEPTICEMIA, AGE 0-17
423 OTHER INFECTIOUS AND PARASITIC DISEASES DIAGNOSES

FTR 5 - Shock or Cardiac Arrest

Include ICD-9-CM Shock or Cardiac Arrest diagnosis codes:

4275 CARDIAC ARREST
6395 COMPLICATIONS FOLLOWING ABORTION AND ECTOPIC AND MOLAR PREGNANCIES, SHOCK

Shock during or following labor and delivery:

66910 SHOCK DURING OR FOLLOWING LABOR AND DELIVERY – UNSPECIFIED AS TO EPISODE OF CARE OR NOT APPLICABLE
66911 SHOCK DURING OR FOLLOWING LABOR AND DELIVERY – DELIVERED, W/ OR W/O MENTION OF ANTEPARTUM CONDITION
66912 SHOCK DURING OR FOLLOWING LABOR AND DELIVERY – DELIVERED, W/ MENTION OF POSTPARTUM COMPLICATION
66913 SHOCK DURING OR FOLLOWING LABOR AND DELIVERY – ANTEPARTUM CONDITION OR COMPLICATION
66914 SHOCK DURING OR FOLLOWING LABOR AND DELIVERY – POSTPARTUM CONDITION OR COMPLICATION
7855 SHOCK NOS
78550 SHOCK, UNSPECIFIED
78551 CARDIOGENIC SHOCK
78552 SEPTIC SHOCK (OCT 03)
78559 SHOCK W/O MENTION OF TRAUMA- OTHER
7991 RESPIRATORY ARREST
9950 OTHER ANAPHYLACTIC SHOCK
9954 SHOCK DUE TO ANESTHESIA
9980 POSTOPERATIVE SHOCK
9994 ANAPHYLACTIC SHOCK DUE TO SERUM

ICD-9-CM procedure codes:

9393 NONMECHANICAL METHODS OF RESUSCITATION
9960 CARDIOPULMONARY RESUSCITATION, NOS
9963 CLOSED CHEST CARDIAC MASSAGE

Exclude:

MDC 4 and 5, principal diagnosis of shock or cardiac arrest, abortion-related shock, hemorrhage, trauma, GI hemorrhage.

MDC 4 DISEASES AND DISORDERS OF THE RESPIRATORY SYSTEM
MDC 5 DISEASES AND DISORDERS OF THE CIRCULATORY SYSTEM

Failure to Rescue (PSI 4)

ICD-9-CM Abortion-related Shock diagnosis codes:

63450 SPONTANEOUS ABORTION W/ SHOCK - UNSPECIFIED
63451 SPONTANEOUS ABORTION W/ SHOCK - INCOMPLETE
63452 SPONTANEOUS ABORTION W/ SHOCK - COMPLETE
63550 LEGAL ABORTION W/ SHOCK - UNSPECIFIED
63551 LEGAL ABORTION W/ SHOCK - INCOMPLETE

- 53390 SITE UNSPECIFIED AS ACUTE OR CHRONIC, W/O MENTION OF HEMORRHAGE OR PERFORATION – W/O MENTION OF OBSTRUCTION
- 53391 UNSPECIFIED AS ACUTE OR CHRONIC, W/O MENTION OF HEMORRHAGE OR PERFORATION – W/ OBSTRUCTION

Gastrojejunal ulcer:

- 53400 ACUTE W/ HEMORRHAGE – W/O MENTION OF OBSTRUCTION
- 53401 ACUTE W/ HEMORRHAGE – W/ OBSTRUCTION
- 53410 ACUTE W/ PERFORATION – W/O MENTION OF OBSTRUCTION
- 53411 ACUTE W/ PERFORATION – W/ OBSTRUCTION
- 53420 ACUTE W/ HEMORRHAGE AND PERFORATION – W/O MENTION OF OBSTRUCTION
- 53421 ACUTE W/ HEMORRHAGE AND PERFORATION – W/ OBSTRUCTION
- 53430 ACUTE W/O MENTION OF HEMORRHAGE OR PERFORATION – W/O MENTION OF OBSTRUCTION
- 53431 ACUTE W/O MENTION OF HEMORRHAGE OR PERFORATION – W/ OBSTRUCTION
- 53490 UNSPECIFIED AS ACUTE OR CHRONIC, W/O MENTION OF HEMORRHAGE OR PERFORATION – W/O MENTION OF OBSTRUCTION
- 53491 UNSPECIFIED AS ACUTE OR CHRONIC, W/O MENTION OF HEMORRHAGE OR PERFORATION – W/ OBSTRUCTION

Gastritis and duodenitis:

- 53501 ACUTE GASTRITIS – W/ HEMORRHAGE
- 53511 ATROPHIC GASTRITIS – W/ HEMORRHAGE
- 53521 GASTRIC MUCOSAL HYPERTROPHY – W/ HEMORRHAGE
- 53531 ALCOHOLIC GASTRITIS – W/ HEMORRHAGE
- 53541 OTHER SPECIFIED GASTRITIS – W/ HEMORRHAGE
- 53551 UNSPECIFIED GASTRITIS AND GASTRODUODENITIS – W/ HEMORRHAGE
- 53561 DUODENITIS – W/ HEMORRHAGE
- 53783 ANGIODYSPLASIA OF STOMACH AND DUODENUM – W/ HEMORRHAGE
- 53784 DIEULAFOY LESION (HEMORRHAGIC) OF STOMACH AND DUODENUM

Failure to Rescue (PSI 4)

56202 DIVERTICULOSIS OF SMALL INTESTINE – W/ HEMORRHAGE
56203 DIVERTICULITIS OF SMALL INTESTINE – W/ HEMORRHAGE
56212 DIVERTICULOSIS OF COLON – W/ HEMORRHAGE
56213 DIVERTICULITIS OF COLON – W/ HEMORRHAGE

5693 HEMORRHAGE OF RECTUM AND ANUS
56985 ANGIODYSPLASIA OF INTESTINE – W/ HEMORRHAGE
56986 DIEULAFOY LESION (HEMORRHAGIC) OF INTESTINE
5780 HEMATEMESIS
5781 BLOOD IN STOOL
5789 HEMORRHAGE OF GASTROINTESTINAL TRACT, UNSPECIFIED

Exclude:

MDC codes 6, 7, principal diagnosis of GI hemorrhage/Acute Ulcer, trauma, alcoholism and ICD-9-CM diagnosis codes 280.0 and 285.1:

MDC 6 DISEASES AND DISORDERS OF THE DIGESTIVE SYSTEM
MDC 7 DISEASES AND DISORDERS OF THE HEPATOBILIARY SYSTEM AND PANCREAS

2800 SECONDARY TO BLOOD LOSS [CHRONIC]
2851 ACUTE POSTHEMORRHAGIC ANEMIA

ICD-9-CM Trauma Diagnosis Codes:

See PSI 2 **Death in Low Mortality DRGs** for a list of trauma diagnosis codes

DRGs:

See FTR 1 **Acute Renal Failure** for list of trauma DRG codes

ICD-9-CM Alcoholism diagnosis codes:

2910 ALCOHOL WITHDRAWAL DELIRIUM
2911 ALCOHOL AMNESTIC SYNDROME
2912 OTHER ALCOHOLIC DEMENTIA
2913 ALCOHOL WITHDRAWAL HALLUCINOSIS
2914 IDIOSYNCRATIC ALCOHOL INTOXICATION
2915 ALCOHOLIC JEALOUSY
29181 OTHER SPECIFIED ALCOHOLIC PSYCHOSES, ALCOHOL WITHDRAWAL
29189 OTHER SPECIFIED ALCOHOLIC PSYCHOSES, OTHER
2919 UNSPECIFIED ALCOHOLIC PSYCHOSIS
30300 ACUTE ALCOHOLIC INTOXICATION - UNSPECIFIED
30301 ACUTE ALCOHOLIC INTOXICATION - CONTINUOUS
30302 ACUTE ALCOHOLIC INTOXICATION - EPISODIC
30303 ACUTE ALCOHOLIC INTOXICATION - IN REMISSION

30391 OTHER AND UNSPECIFIED ALCOHOL DEPENDENCE - CONTINUOUS
30392 OTHER AND UNSPECIFIED ALCOHOL DEPENDENCE - EPISODIC
30393 OTHER AND UNSPECIFIED ALCOHOL DEPENDENCE - IN REMISSION
30500 NONDEPENDENT ABUSE OF DRUGS, ALCOHOL ABUSE - UNSPECIFIED
30501 NONDEPENDENT ABUSE OF DRUGS, ALCOHOL ABUSE - CONTINUOUS
30502 NONDEPENDENT ABUSE OF DRUGS, ALCOHOL ABUSE - EPISODIC
30503 NONDEPENDENT ABUSE OF DRUGS, ALCOHOL ABUSE – IN REMISSION
4255 ALCOHOLIC CARDIOMYOPATHY
53530 ALCOHOLIC GASTRITIS, W/O MENTION OF HEMORRHAGE
53531 ALCOHOLIC GASTRITIS, W/ HEMORRHAGE
5710 ALCOHOLIC FATTY LIVER
5711 ACUTE ALCOHOLIC HEPATITIS
5712 ALCOHOLIC CIRRHOSIS OF LIVER

Failure to Rescue (PSI 4)

5713 ALCOHOLIC LIVER DAMAGE, UNSPECIFIED
9800 TOXIC EFFECT OF ALCOHOL, ETHYL ALCOHOL
9809 TOXIC EFFECT OF ALCOHOL, UNSPECIFIED ALCOHOL

Exclude:

Patients age 75 years and older.

Neonatal patients in MDC 15 (Newborns and Other Neonates with Conditions Originating in the Neonatal Period).

Patients transferred to an acute care facility
Patients transferred from an acute care facility
Patients admitted from a long-term care facility

Transferred to Acute Care Facility:

Discharge disposition recorded as transfer to another acute care facility (Discharge Disposition = 2)

Transferred from Acute Care or Long-Term Care Facility:

Admission source is recorded as acute care facility (Admission Source = 2)
Admission source is recorded as long-term care facility (Admission Source=3)

Foreign Body Left during Procedure, Secondary Diagnosis Field (PSI 5 and 21)**Numerator:**

Discharges with ICD-9-CM codes for foreign body left in during procedure in any secondary diagnosis field.

ICD-9-CM Foreign Body Left in During Procedure diagnosis codes:

9984 FOREIGN BODY ACCIDENTALLY LEFT DURING A PROCEDURE
9987 ACUTE REACTIONS TO FOREIGN SUBSTANCE ACCIDENTALLY LEFT DURING A PROCEDURE

Foreign body left in during:

E8710 SURGICAL OPERATION
E8711 INFUSION OR TRANSFUSION
E8712 KIDNEY DIALYSIS OR OTHER PERFUSION
E8713 INJECTION OR VACCINATION
E8714 ENDOSCOPIC EXAMINATION
E8715 ASPIRATION OF FLUID OR TISSUE, PUNCTURE, AND CATHETERIZATION
E8716 HEART CATHETERIZATION
E8717 REMOVAL OF CATHETER OR PACKING
E8718 OTHER SPECIFIED PROCEDURES
E8719 UNSPECIFIED PROCEDURE

Denominator:

All medical and surgical discharges defined by specific DRGs

Surgical Discharge DRGs:

See PSI 1 **Complications of Anesthesia** for a list of surgical DRG codes.

Foreign Body Left during Procedure, Secondary Diagnosis Field (PSI 5 and 21)*Medical Discharge DRGs:*

See PSI 3 **Decubitus Ulcer** for a list of medical DRG codes.

Exclude:

Patients with ICD-9-CM codes for foreign body left in during procedure in the principal diagnosis field.

Iatrogenic Pneumothorax, Secondary Diagnosis Field (PSI 6 and 22)**Numerator:**

Discharges with ICD-9-CM code of 512.1 in any secondary diagnosis field.

Denominator:

All medical and surgical discharges defined by specific DRGs

Surgical Discharge DRGs:

See PSI 1 **Complications of Anesthesia** for a list of surgical DRG codes.

Medical Discharge DRGs:

See PSI 3 **Decubitus Ulcer** for a list of medical DRG codes.

Exclude:

Patients with ICD-9-CM code of 512.1 in the principal diagnosis field.

Patients with any diagnosis of trauma.

Patients with any code indicating thoracic surgery, lung or pleural biopsy, or assigned to cardiac surgery DRGs

Obstetrical patients in MDC 14 (Pregnancy, Childbirth and the Puerperium).

ICD-9-CM Trauma diagnosis codes (includes 4th and 5th digits):

See PSI 2 **Death In Low Mortality DRGs** for a list of trauma diagnosis codes.

DRGs:

See FTR 1 **Acute Renal Failure** for a list of trauma DRG codes.

ICD-9-CM Thoracic Surgery procedure codes:

3121	MEDIASTINAL TRACHEOSTOMY
3145	OPEN BIOPSY OF LARYNX OR TRACHEA
3173	CLOSURE OF OTHER FISTULA OF TRACHEA
3179	OTHER REPAIR AND PLASTIC OPERATIONS ON TRACHEA
3199	OTHER OPERATIONS ON TRACHEA
3209	OTHER LOCAL EXCISION OR DESTRUCTION OF LESION OR TISSUE OF BRONCHUS
321	OTHER EXCISION OF BRONCHUS

Local excision or destruction of lesion or tissue of lung:

3221	PLICATION OF EMPHYSEMATIOUS BLEB
3222	LUNG VOLUME REDUCTION SURGERY

Iatrogenic Pneumothorax, Secondary Diagnosis Field (PSI 6 and 22)

3228 ENDOSCOPIC EXCISION OR DESTRUCTION OF LESION OR TISSUE OF LUNG
3229 OTHER LOCAL EXCISION OR DESTRUCTION OF LESION OR TISSUE OF LUNG
323 SEGMENTAL RESECTION OF LUNG
324 LOBECTOMY OF LUNG
325 COMPLETE PNEUMONECTOMY
326 RADICAL DISSECTION OF THORACIC STRUCTURES
329 OTHER EXCISION OF LUNG
330 INCISION OF BRONCHUS
331 INCISION OF LUNG
3325 OPEN BIOPSY OF BRONCHUS
3326 CLOSE [PERCUTANEOUS][NEEDLE] BIOPSY OF LUNG
3327 CLOSED ENDOSCOPIC BIOPSY OF LUNG
3328 OPEN BIOPSY OF LUNG
3331 DESTRUCTION OF PHRENIC NERVE FOR COLLAPSE OF LUNG (NO LONGER PERFORMED)
3332 ARTIFICIAL PNEUMOTHORAX FOR COLLAPSE OF LUNG
3334 THORACOPLASTY
3339 OTHER SURGICAL COLLAPSE OF LUNG

Repair and plastic operation on lung and bronchus:

3341 SUTURE OF LACERATION OF BRONCHUS
3342 CLOSURE OF BRONCHIAL FISTULA
3343 CLOSURE OF LACERATION OF LUNG
3348 OTHER REPAIR AND PLASTIC OPERATIONS ON BRONCHUS
3349 OTHER REPAIR AND PLASTIC OPERATIONS ON LUNG

Lung transplant:

335 LUNG TRANSPLANTATION
3350 LUNG TRANSPLANTATION, NOS
3351 UNILATERAL LUNG TRANSPLANTATION
3352 BILATERAL LUNG TRANSPLANTATION
336 COMBINED HEART-LUNG TRANSPLANTATION
3392 LIGATION OF BRONCHUS
3393 PUNCTURE OF LUNG
3398 OTHER OPERATIONS ON BRONCHUS
3399 OTHER OPERATIONS ON LUNG
3329 OTHER DIAGNOSTIC PROCEDURE ON LUNG AND BRONCHUS
3333 PNEUMOPERITONEUM FOR COLLAPSE OF LUNG
3401 INCISION OF CHEST WALL
3402 EXPLORATORY THORACOTOMY
3403 REOPENING OF RECENT THORACOTOMY SITE
3405 CREATION OF PLEUROPERITONEAL SHUNT
3409 OTHER INCISION OF PLEURA
341 INCISION OF MEDIASTINUM

Diagnostic procedures on chest wall, pleura, mediastinum, and diaphragm:

3421 TRANSPLEURAL THORACOSCOPY
3422 MEDIASTINOSCOPY
3423 BIOPSY OF CHEST WALL
3424 PLEURAL BIOPSY
3425 CLOSED [PERCUTANEOUS][NEEDLE] BIOPSY OF MEDIASTINUM
3426 OPEN BIOPSY OF MEDIASTINUM
3427 BIOPSY OF DIAPHRAGM
3428 OTHER DIAGNOSTIC PROCEDURES ON CHEST WALL, PLEURA, AND DIAPHRAGM
3429 OTHER DIAGNOSTIC PROCEDURES ON MEDIASTINUM
343 EXCISION OR DESTRUCTION OF LESION OR TISSUE OF MEDIASTINUM
344 EXCISION OR DESTRUCTION OF LESION OF CHEST WALL
3451 DECORTICATION OF LUNG
3459 OTHER EXCISION OF PLEURA

Iatrogenic Pneumothorax, Secondary Diagnosis Field (PSI 6 and 22)

Repair of chest wall:

- 3471 SUTURE OF LACERATION OF CHEST WALL
- 3472 CLOSURE OF THORACOSTOMY
- 3473 CLOSURE OF OTHER FISTULA OF THORAX
- 3474 REPAIR OF PECTUS DEFORMITY
- 3479 OTHER REPAIR OF CHEST WALL

Operations on diaphragm:

- 3481 EXCISION OF LESION OR TISSUE OF DIAPHRAGM
- 3482 SUTURE OF LACERATION OF DIAPHRAGM
- 3483 CLOSURE OF FISTULA OF DIAPHRAGM
- 3484 OTHER REPAIR OF DIAPHRAGM
- 3485 IMPLANTATION OF DIAPHRAGMATIC PACEMAKER
- 3489 OTHER OPERATIONS ON DIAPHRAGM
- 3493 REPAIR OF PLEURA
- 3499 OTHER OPERATIONS ON THORAX, OTHER

Operations on thoracic duct:

- 4061 CANNULATION OF THORACIC DUCT
- 4062 FISTULIZATION OF THORACIC DUCT
- 4063 CLOSURE OF FISTULA OF THORACIC DUCT
- 4064 LIGATION OF THORACIC DUCT
- 4069 OTHER OPERATIONS ON THORACIC DUCT

Esophagotomy:

- 4201 INCISION OF ESOPHAGEAL WEB
- 4209 OTHER INCISION OF ESOPHAGUS
- 4210 ESOPHAGOSTOMY, NOS
- 4211 CERVICAL ESOPHAGOSTOMY
- 4212 EXTERIORIZATION OF ESOPHAGEAL POUCH
- 4219 OTHER EXTERNAL FISTULIZATION OF ESOPHAGUS
- 4221 OPERATIVE ESOPHAGOSCOPY BY INCISION
- 4225 OPEN BIOPSY OF ESOPHAGUS
- 4231 LOCAL EXCISION OF ESOPHAGEAL DIVERTICULUM
- 4232 LOCAL EXCISION OF OTHER LESION OR TISSUE OF ESOPHAGUS
- 4239 OTHER DESTRUCTION OF LESION OR TISSUE OF ESOPHAGUS

Excision of esophagus:

- 4240 ESOPHAGECTOMY, NOS
- 4241 PARTIAL ESOPHAGECTOMY
- 4242 TOTAL ESOPHAGECTOMY

Intrathoracic anastomosis of esophagus

- 4251 INTRATHORACIC ESOPHAGUESOPHAGOSTOMY
- 4252 INTRATHORACIC ESOPHAGOGASTROSTOMY
- 4253 INTRATHORACIC ESOPHAGEAL ANASTOMOSIS W/ INTERPOSITION OF SMALL BOWEL
- 4254 OTHER INTRATHORACIC ESOPHAGOENTEROSTOMY
- 4255 INTRATHORACIC ESOPHAGEAL ANASTOMOSIS W/ INTERPOSITION OF COLON
- 4256 OTHER INTRATHORACIC ESOPHAGOCOLOSTOMY
- 4258 INTRATHORACIC ESOPHAGEAL ANASTOMOSIS W/ OTHER INTERPOSITION
- 4259 OTHER INTRATHORACIC ANASTOMOSIS OF ESOPHAGUS

Iatrogenic Pneumothorax, Secondary Diagnosis Field (PSI 6 and 22)**Antesternal anastomosis**

4261 ANTESTERNAL ESOPHAGUESOPHAGOSTOMY
4262 ANTESTERNAL ESOPHAGOGASTROSTOMY
4263 ANTESTERNAL ESOPHAGEAL ANASTOMOSIS W/ INTERPOSITION OF SMALL BOWEL
4264 OTHER ANTESTERNAL ESOPHAGOENTEROSTOMY
4265 ANTESTERNAL ESOPHAGEAL ANASTOMOSIS W/ INTERPOSITION OF COLON
4266 OTHER ANTESTERNAL ESOPHAGOCOLOSTOMY
4268 OTHER ANTESTERNAL ESOPHAGEAL ANASTOMOSIS W/ INTERPOSITION
4269 OTHER ANTESTERNAL ANASTOMOSIS OF ESOPHAGUS
427 ESOPHAGOMYOTOMY

Other repair of esophagus

4281 INSERTION OF PERMANENT TUBE INTO ESOPHAGUS
4282 SUTURE OF LACERATION OF ESOPHAGUS
4283 CLOSURE OF ESOPHAGOSTOMY
4284 REPAIR OF ESOPHAGEAL FISTULA, NEC
4285 REPAIR OF ESOPHAGEAL STRICTURE
4286 PRODUCTION OF SUBCUTANEOUS TUNNEL W/O ESOPHAGEAL ANASTOMOSIS
4287 OTHER GRAFT OF ESOPHAGUS
4289 OTHER REPAIR OF ESOPHAGUS
4465 ESOPHAGOGASTROPLASTY
4466 OTHER PROCEDURES FOR CREATION OF ESOPHAGOGASTRIC SPHINCTERIC COMPETENCE
8104 DORSAL AND DORSO-LUMBAR FUSION, ANTERIOR TECHNIQUE
8134 REFUSION OF DORSAL AND DORSOLUMBAR SPINE, ANTERIOR TECHNIQUE

ICD-9-CM Lung or Pleural Biopsy procedure codes:

3326 CLOSED [PERCUTANEOUS] [NEEDLE] BIOPSY OF LUNG
3328 OPEN BIOPSY OF LUNG
3424 PLEURAL BIOPSY

Cardiac Surgery DRGs:

103 HEART TRANSPLANT
104 CARDIAC VALVE AND OTHER MAJOR CARDIOTHORACIC PROCEDURES W/ CARDIAC CATHETERIZATION
105 CARDIAC VALVE AND OTHER MAJOR CARDIOTHORACIC PROCEDURES W/O CARDIAC CATHETERIZATION
106 CORONARY BYPASS W/ PTCA
107 CORONARY BYPASS W/ CARDIAC CATHETERIZATION
108 OTHER CARDIOTHORACIC PROCEDURES
109 CORONARY BYPASS W/O CARDIAC CATHETERIZATION
110 MAJOR CARDIOVASCULAR PROCEDURES W/ CC
111 MAJOR CARDIOVASCULAR PROCEDURES W/O CC
525 HEART ASSIST SYSTEM IMPLANT (OCT 02)

Selected Infections Due to Medical Care, Secondary Diagnosis Field (PSI 7 and 23)**Numerator:**

Discharges with ICD-9-CM code of 999.3 or 996.62 in any secondary diagnosis field.

Denominator:

All medical and surgical discharges defined by specific DRGs

Selected Infections Due to Medical Care, Secondary Diagnosis Field (PSI 7 and 23)

Surgical Discharge DRGs:

See PSI 1 **Complications of Anesthesia** for a list of surgical DRG codes.

Medical Discharge DRGs:

See PSI 3 **Decubitus Ulcer** for a list of medical DRG codes.

Exclude:

Patients with ICD-9-CM code of 999.3 or 996.62 in the principal diagnosis field

Patients with any code for immunocompromised state or cancer.

ICD-9-CM Immunocompromised States diagnosis codes:

See PSI 2 **Death in Low Mortality DRGs** for a list of immunocompromised states diagnosis codes.

ICD-9-CM procedure codes:

See PSI 2 **Death in Low Mortality DRGs** for a list of immunocompromised states procedure codes.

Cancer:

See PSI 2 **Death in Low Mortality DRGs** for a list of cancer diagnosis codes

DRGs:

010	NERVOUS SYSTEM NEOPLASMS W/ CC
011	NERVOUS SYSTEM NEOPLASMS W/O CC
064	EAR, NOSE, MOUTH AND THROAT MALIGNANCY
082	RESPIRATORY NEOPLASMS
172	DIGESTIVE MALIGNANCY W/ CC
173	DIGESTIVE MALIGNANCY W/O CC
199	HEPATOBIILIARY DIAGNOSTIC PROCEDURE FOR MALIGNANCY
203	MALIGNANCY OF HEPATOBIILIARY SYSTEM OR PANCREAS
239	PATHOLOGICAL FRACTURES AND MUSCULOSKELETAL AND CONNECTIVE TISSUE MALIGNANCY
257	TOTAL MASTECTOMY FOR MALIGNANCY W/ CC
258	TOTAL MASTECTOMY FOR MALIGNANCY W/O CC
259	SUBTOTAL MASTECTOMY FOR MALIGNANCY W/ CC
260	SUBTOTAL MASTECTOMY FOR MALIGNANCY W/O CC
274	MALIGNANT BREAST DISORDERS W/ CC
275	MALIGNANT BREAST DISORDERS W/O CC
303	KIDNEY, URETER AND MAJOR BLADDER PROCEDURES FOR NEOPLASM
318	KIDNEY AND URINARY TRACT NEOPLASMS W/ CC
319	KIDNEY AND URINARY TRACT NEOPLASMS W/O CC
338	TESTES PROCEDURES FOR MALIGNANCY
344	OTHER MALE REPRODUCTIVE SYSTEM OR PROCEDURES FOR MALIGNANCY
346	MALIGNANCY OF MALE REPRODUCTIVE SYSTEM W/ CC
347	MALIGNANCY OF MALE REPRODUCTIVE SYSTEM W/O CC
354	UTERINE AND ADNEXA PROCEDURES FOR NONOVARIAN/ADNEXAL MALIGNANCY W/ CC
355	UTERINE AND ADNEXA PROCEDURES FOR NONOVARIAN/ADNEXAL MALIGNANCY W/O CC
357	UTERINE AND ADNEXA PROCEDURES FOR OVARIAN OR ADNEXAL MALIGNANCY
363	D AND C, CONIZATION AND RADIOIMPLANT FOR MALIGNANCY
367	MALIGNANCY OF FEMALE REPRODUCTIVE SYSTEM W/O CC
400*	LYMPHOMA AND LEUKEMIA W/ MAJOR OR PROCEDURES
401	LYMPHOMA AND NONACUTE LEUKEMIA W/ OTHER OR PROCEDURE W/ CC
402	LYMPHOMA AND NONACUTE LEUKEMIA W/ OTHER OR PROCEDURE W/O CC
403	LYMPHOMA AND NONACUTE LEUKEMIA W/ CC
404	LYMPHOMA AND NONACUTE LEUKEMIA W/O CC
405	ACUTE LEUKEMIA W/O MAJOR OR PROCEDURE, AGE 0-17

Selected Infections Due to Medical Care, Secondary Diagnosis Field (PSI 7 and 23)

406	MYELOPROLIFERATIVE DISORDERS OR POORLY DIFFERENTIATED NEOPLASMS W/ MAJOR OR PROCEDURES W/ CC
407	MYELOPROLIFERATIVE DISORDERS OR POORLY DIFFERENTIATED NEOPLASMS W/ MAJOR OR PROCEDURE W/O CC
408	MYELOPROLIFERATIVE DISORDERS OR POORLY DIFFERENTIATED NEOPLASMS W/ OTHER OR PROCEDURES
409	RADIOTHERAPY
410	CHEMOTHERAPY W/O ACUTE LEUKEMIA AS SECONDARY DIAGNOSIS
411	HISTORY OF MALIGNANCY W/O ENDOSCOPY
412	HISTORY OF MALIGNANCY W/ ENDOSCOPY
413	OTHER MYELOPROLIFERATIVE DISORDERS OR POORLY DIFFERENTIATED NEOPLASM DIAGNOSES W/ CC
414	OTHER MYELOPROLIFERATIVE DISORDERS OR POORLY DIFFERENTIATED NEOPLASM DIAGNOSES W/O CC
473	ACUTE LEUKEMIA W/O MAJOR OR PROCEDURE, AGE GREATER THAN 17
492	CHEMOTHERAPY W/ ACUTE LEUKEMIA AS SECONDARY DIAGNOSIS
539	LYMPHOMA & LEUKEMIA W MAJOR OR PROCEDURE W/ CC (OCT 03)
540	LYMPHOMA & LEUKEMIA W MAJOR OR PROCEDURE W/O CC (OCT 03)

*No Longer valid in FY2005

Postoperative Hip Fracture (PSI 8)**Numerator:**

Discharges with ICD-9-CM code for hip fracture in any secondary diagnosis field

ICD-9-CM Hip Fracture diagnosis codes (includes all 5th digits):

8200	FRACTURE OF NECK OF FEMUR – TRANSCERVICAL FRACTURE, CLOSED
8201	FRACTURE OF NECK OF FEMUR – TRANSCERVICAL FRACTURE, OPEN
8202	FRACTURE OF NECK OF FEMUR – PERTROCHANTERIC FRACTURE, CLOSED
8203	FRACTURE OF NECK OF FEMUR – PERTROCHANTERIC FRACTURE, OPEN
8208	UNSPECIFIED PART OF NECK OF FEMUR, CLOSED
8209	UNSPECIFIED PART OF NECK OF FEMUR, OPEN

Denominator:

All surgical discharges defined by specific DRGs and an ICD-9-CM code for an operating room procedure (Appendix C).

Surgical Discharge DRGs:

See PSI 1 **Complications of Anesthesia** for a list of surgical DRG codes.

Exclude:

Patients with ICD-9-CM code for hip fracture in the principal diagnosis field.

Patients where the only operating room procedure is hip fracture repair.

Patients where a procedure for hip fracture repair occurs before the first operating room procedure.

Note: If day of procedure is not available in the input data file, the rate may be slightly lower than if the information was available

Patients who have diseases and disorders of the musculoskeletal system and connective tissue (MDC 8).

Postoperative Hip Fracture (PSI 8)

Patients with principal diagnosis codes for seizure, syncope, stroke, coma, cardiac arrest, poisoning, trauma, delirium and other psychoses, or anoxic brain injury.

Patients with any diagnosis of metastatic cancer, lymphoid malignancy or bone malignancy, or self-inflicted injury.

Obstetrical patients in MDC14 (Pregnancy, Childbirth and the Puerperium).

Patients 17 years of age and younger.

ICD-9-CM Hip Fracture Repair procedure codes:

7855	INTERNAL FIXATION-FEMUR
7915	CLOSED RED-INT FIX FEMUR
7925	OPEN REDUCTION-FEMUR FX
7935	OPEN REDUC-INT FIX FEMUR
8151	TOTAL HIP REPLACEMENT
8152	PARTIAL HIP REPLACEMENT

ICD-9-CM Seizure diagnosis codes:

34500	GENERALIZED NONCONVULSIVE EPILEPSY – W/O MENTION OF INTRACTABLE EPILEPSY
34501	GENERALIZED NONCONVULSIVE EPILEPSY – W/ INTRACTABLE EPILEPSY
34510	GENERALIZED CONVULSIVE EPILEPSY – W/O MENTION OF INTRACTABLE EPILEPSY
34511	GENERALIZED CONVULSIVE EPILEPSY – W/ INTRACTABLE EPILEPSY
3452	EPILEPSY – PETIT MAL STATUS
3453	EPILEPSY – GRAND MAL STATUS
34540	PARTIAL EPILEPSY, W/ IMPAIRMENT OF CONSCIOUSNESS – W/O INTRACTABLE EPILEPSY
34541	PARTIAL EPILEPSY, W/ IMPAIRMENT OF CONSCIOUSNESS – W/ MENTION OF INTRACTABLE EPILEPSY
34550	PARTIAL EPILEPSY, W/O MENTION OF IMPAIRMENT OF CONSCIOUSNESS – W/O MENTION OF INTRACTABLE EPILEPSY
34551	PARTIAL EPILEPSY, W/O MENTION OF IMPAIRMENT OF CONSCIOUSNESS – W/ INTRACTABLE EPILEPSY
34560	INFANTILE SPASMS – W/O MENTION OF INTRACTABLE EPILEPSY
34561	INFANTILE SPASMS – W/ INTRACTABLE EPILEPSY
34570	EPILEPSIA PARTIALIS CONTINUA – W/O MENTION OF INTRACTABLE EPILEPSY
34571	EPILEPSIA PARTIALIS CONTINUA – W/ INTRACTABLE EPILEPSY
34580	OTHER FORMS OF EPILEPSY – W/O MENTION OF INTRACTABLE EPILEPSY
34581	OTHER FORMS OF EPILEPSY – W/ INTRACTABLE EPILEPSY
34590	EPILEPSY, UNSPECIFIED – W/O MENTION OF INTRACTABLE EPILEPSY
34591	EPILEPSY, UNSPECIFIED – W/ INTRACTABLE EPILEPSY
7803	CONVULSIONS
78031	FEBRILE CONVULSIONS
78039	OTHER CONVULSIONS
7803	CONVULSIONS (OLD CODE NO LONGER VALID)

ICD-9-CM Syncope diagnosis codes:

7802	SYNCOPE AND COLLAPSE
------	----------------------

ICD-9-CM Stroke diagnosis codes:

430	SUBARACHNOID HEMORRHAGE
431	INTRACEREBRAL HEMORRHAGE
4320	NONTRAUMATIC EXTRADURAL HEMORRHAGE
4321	SUBDURAL HEMORRHAGE
4329	UNSPECIFIED INTRACRANIAL HEMORRHAGE
436	ACUTE, BUT ILL-DEFINED CEREBROVASCULAR DISEASE
99702	POSTOPERATIVE CEREBROVASCULAR ACCIDENT

Postoperative Hip Fracture (PSI 8)

Occlusion and stenosis of precerebral arteries:

43301 BASILAR ARTERY, W/ CEREBRAL INFARCTION
43311 CAROTID ARTERY, W/ CEREBRAL INFARCTION
43321 VERTEBRAL ARTERY - W/ CEREBRAL INFARCTION
43331 MULTIPLE AND BILATERAL W/ CEREBRAL INFARCTION
43381 OTHER SPECIFIED PRECEREBRAL ARTERY W/ CEREBRAL INFARCTION
43391 OCCLUSION AND STENOSIS OF PRECEREBRAL ARTERIES, UNSPECIFIED PRECEREBRAL ARTERY W/ CEREBRAL INFARCTION

Occlusion of cerebral arteries:

43401 CEREBRAL THROMBOSIS – W/ CEREBRAL INFARCTION
43411 CEREBRAL EMBOLISM – W/ CEREBRAL INFARCTION
43491 CEREBRAL ARTERY OCCLUSION, UNSPECIFIED - W/ CEREBRAL INFARCTION

ICD-9-CM Coma diagnosis codes:

25020 DIABETES W/ HYPEROSMOLARITY, TYPE 2 [NONINSULIN DEPENDENT TYPE][NIDDM TYPE][ADULT-ONSET] OR UNSPECIFIED TYPE, NOT STATED AS UNCONTROLLED
25021 DIABETES W/ HYPEROSMOLARITY, TYPE 1 [INSULIN DEPENDENT TYPE][IDDM-TYPE] [JUVENILE TYPE], NOT STATED AS UNCONTROLLED
25022 DIABETES W/ HYPEROSMOLARITY, TYPE 2
25023 DIABETES MELLITUS, DIABETES W/ HYPEROSMOLARITY, TYPE 1 [INSULIN DEPENDENT TYPE][IDDM-TYPE][JUVENILE TYPE] UNCONTROLLED
25030 DIABETES W/ OTHER COMA, TYPE 2 NOT STATED AS UNCONTROLLED
25031 DIABETES W/ OTHER COMA, TYPE 1 NOT STATED AS UNCONTROLLED
25032 DIABETES MELLITUS, DIABETES W/ OTHER COMA, TYPE 2 UNCONTROLLED
25033 DIABETES MELLITUS, DIABETES W/ OTHER COMA, TYPE 1 UNCONTROLLED
2510 OTHER DISORDERS OF PANCREATIC INTERNAL SECRETION, HYPOGLYCEMIC COMA
5722 LIVER ABSCESS AND SEQUELAE OF CHRONIC LIVER DISEASE, HEPATIC COMA
78001 GENERAL SYMPTOMS, ALTERATION OF CONSCIOUSNESS, COMA
78003 GENERAL SYMPTOMS, ALTERATION OF CONSCIOUSNESS PERSISTENT VEGETATIVE STATE

ICD-9-CM Cardiac Arrest diagnosis code:

See FTR 1 **Acute Renal Failure** for a list of cardiac arrest diagnosis codes.

ICD-9-CM Poisoning diagnosis codes (includes 4th and 5th digits):

960 POISONING BY ANTIBIOTICS
961 POISONING BY OTHER ANTI-INFECTIVES
962 POISONING BY HORMONES AND SYNTHETIC SUBSTITUTES
963 POISONING BY PRIMARILY SYSTEMIC AGENTS
964 POISONING BY AGENTS PRIMARILY AFFECTING BLOOD CONSTITUENTS
965 POISONING BY ANALGESICS, ANTIPYRETICS, AND ANTIRHEUMATICS
966 POISONING BY ANTICONVULSANTS AND ANTI-PARKINSONISM DRUGS
967 POISONING BY SEDATIVES AND HYPNOTICS
968 POISONING BY OTHER CENTRAL NERVOUS SYSTEM DEPRESSANTS AND ANESTHETICS
969 POISONING BY PSYCHOTROPIC AGENTS
970 POISONING BY CENTRAL NERVOUS SYSTEM STIMULANTS
971 POISONING BY DRUGS PRIMARILY AFFECTING THE AUTONOMIC NERVOUS SYSTEM
972 POISONING BY AGENTS PRIMARILY AFFECTING THE CARDIOVASCULAR SYSTEM
973 POISONING BY AGENTS PRIMARILY AFFECTING THE GASTROINTESTINAL SYSTEM
974 POISONING BY WATER, MINERAL, AND URIC ACID METABOLISM DRUGS
975 POISONING BY AGENTS PRIMARILY ACTING ON THE SMOOTH AND SKELETAL MUSCLES AND RESPIRATORY SYSTEM
976 POISONING BY AGENTS PRIMARILY AFFECTING SKIN AND MUCOUS MEMBRANE, OPHTHAMOLOGICAL, OTORHINOLARYNGOLOGICAL AND DENTAL DRUGS

Postoperative Hip Fracture (PSI 8)

977	POISONING BY OTHER AND UNSPECIFIED DRUGS AND MEDICINAL SUBSTANCES
978	POISONING BY BACTERIAL VACCINES
979	POISONING BY OTHER VACCINES AND BIOLOGICAL SUBSTANCES
E850	ACCIDENTAL POISONING BY ANALGESICS, ANTIPYRETICS, AND ANTIRHEUMATICS
E851	ACCIDENTAL POISONING BY BARBITURATES
E852	ACCIDENTAL POISONING BY OTHER SEDATIVES AND HYPNOTICS
E853	ACCIDENTAL POISONING BY TRANQUILIZERS
E854	ACCIDENTAL POISONING BY OTHER PSYCHOTROPIC AGENTS
E855	ACCIDENTAL POISONING BY OTHER DRUGS ACTING ON CENTRAL AND AUTONOMIC NERVOUS SYSTEM
E856	ACCIDENTAL POISONING BY ANTIBIOTICS
E857	ACCIDENTAL POISONING BY OTHER ANTI-INFECTIVES
E858	ACCIDENTAL POISONING BY OTHER DRUGS
E860	ACCIDENTAL POISONING BY ALCOHOL, NEC
E861	ACCIDENTAL POISONING BY CLEANING AND POLISHING AGENTS, DISINFECTANTS, PAINTS, AND VARNISHES
E862	ACCIDENTAL POISONING BY PETROLEUM PRODUCTS, OTHER SOLVENTS AND THEIR VAPORS, NEC
E863	ACCIDENTAL POISONING BY AGRICULTURAL AND HORTICULTURAL CHEMICAL AND PHARMACEUTICAL PREPARATIONS OTHER THAN PLANT FOODS AND FERTILIZERS
E864	ACCIDENTAL POISONING BY CORROSIVES AND CAUSTICS, NEC
E865	ACCIDENTAL POISONING FROM POISONOUS FOODSTUFFS AND POISONOUS PLANTS
E866	ACCIDENTAL POISONING BY OTHER AND UNSPECIFIED SOLID AND LIQUID SUBSTANCES
E867	ACCIDENTAL POISONING BY GAS DISTRIBUTED BY PIPELINE
E868	ACCIDENTAL POISONING BY OTHER UTILITY GAS AND OTHER CARBON MONOXIDE
E869	ACCIDENTAL POISONING BY OTHER GASES AND VAPORS
E951	SUICIDE AND SELF-INFLICTED POISONING BY GASES IN DOMESTIC USE
E952	SUICIDE AND SELF-INFLICTED POISONING BY OTHER GASES AND VAPORS
E962	ASSAULT BY POISONING
E980	POISONING BY SOLID OR LIQUID SUBSTANCES, UNDETERMINED WHETHER ACCIDENTALLY OR PURPOSELY INFLICTED
E981	POISONING BY GASES IN DOMESTIC USE, UNDETERMINED WHETHER ACCIDENTALLY OR PURPOSELY INFLICTED
E982	POISONING BY OTHER GASES, UNDETERMINED WHETHER ACCIDENTALLY OR PURPOSELY INFLICTED

ICD-9-CM Trauma diagnosis codes (includes 4th and 5th digits):

See PSI 2 **Death in Low Mortality** DRGs for a list of trauma diagnosis codes.

DRGs:

See FTR 1 **Acute Renal Failure** for a list of trauma DRG codes.

ICD-9-CM Delirium and Other Psychoses diagnosis codes (includes 4th and 5th digits):

290	SENILE AND PRESENILE ORGANIC PSYCHOTIC CONDITIONS
291	ALCOHOLIC PSYCHOSES
292	DRUG PSYCHOSES
293	TRANSIENT ORGANIC PSYCHOTIC CONDITIONS
294	OTHER ORGANIC PSYCHOTIC CONDITIONS
295	SCHIZOPHRENIC DISORDERS
296	AFFECTIVE PSYCHOSES
297	PARANOID STATES
298	OTHER NONORGANIC PSYCHOSES
299	PSYCHOSES W/ ORIGIN SPECIFIC TO CHILDHOOD

ICD-9-CM Anoxic Brain Injury diagnosis code:

3481	ANOXIC BRAIN DAMAGE
------	---------------------

Postoperative Hip Fracture (PSI 8)

ICD-9-CM Metastatic Cancer diagnosis codes (includes 4th and 5th digits):

196	SECONDARY AND UNSPECIFIED MALIGNANT NEOPLASM OF LYMPH NODES
197	SECONDARY MALIGNANT NEOPLASM OF RESPIRATORY AND DIGESTIVE SYSTEMS
198	SECONDARY MALIGNANT NEOPLASM OF OTHER SPECIFIED SITES
1990	MALIGNANT NEOPLASM W/O SPECIFICATION OF SITE, DISSEMINATED

ICD-9-CM Lymphoid Malignancy diagnosis codes (includes 4th and 5th digits):

200	LYMPHOSARCOMA AND RETICULOSARCOMA
201	HODGKIN'S DISEASE
202	OTHER MALIGNANT NEOPLASMS OF LYMPHOID AND HISTIOCYTIC TISSUE
203	MULTIPLE MYELOMA AND IMMUNOPROLIFERATIVE NEOPLASMS
204	LYMPHOID LEUKEMIA
205	MYELOID LEUKEMIA
206	MONOCYTIC LEUKEMIA
207	OTHER SPECIFIED LEUKEMIA
208	LEUKEMIA OF UNSPECIFIED CELL TYPE

ICD-9-CM Bone Malignancy diagnosis code (includes 4th and 5th digits):

170	MALIGNANT NEOPLASM OF BONE AND ARTICULAR CARTILAGE
-----	--

ICD-9-CM Self-Inflicted Injury diagnosis codes:

See PSI 1 **Complications of Anesthesia** for a list of self-inflicted injury diagnosis codes.

Postoperative Hemorrhage or Hematoma (PSI 9)

Numerator:

Discharges with ICD-9-CM codes for postoperative hemorrhage or postoperative hematoma in any secondary diagnosis field and codes for postoperative control of hemorrhage or drainage of hematoma in any procedure code field.

ICD-9-CM Postoperative Hematoma diagnosis code:

99812	HEMATOMA COMPLICATING A PROCEDURE
-------	-----------------------------------

ICD-9-CM Postoperative Hemorrhage diagnosis code:

99811	HEMORRHAGE COMPLICATING A PROCEDURE
-------	-------------------------------------

ICD-9-CM Control of Postoperative Hemorrhage procedure codes:

287	CONTROL OF HEMORRHAGE AFTER TONSILLECTOMY AND ADENOIDECTOMY
3880	OTHER SURGICAL OCCLUSION OF UNSPECIFIED SITE
3881	OTHER SURGICAL OCCLUSION OF INTRACRANIAL VESSELS
3882	OTHER SURGICAL OCCLUSION OF OTHER VESSELS OF HEAD AND NECK
3883	OTHER SURGICAL OCCLUSION OF UPPER LIMB VESSELS
3884	OTHER SURGICAL OCCLUSION OF AORTA, ABDOMINAL
3885	OTHER SURGICAL OCCLUSION OF THORACIC VESSEL
3886	OTHER SURGICAL OCCLUSION OF ABDOMINAL ARTERIES
3887	OTHER SURGICAL OCCLUSION OF ABDOMINAL VEINS
3888	OTHER SURGICAL OCCLUSION OF LOWER LIMB ARTERIES

Postoperative Hemorrhage or Hematoma (PSI 9)

3889 OTHER SURGICAL OCCLUSION OF LOWER LIMB VEINS
3941 CONTROL OF HEMORRHAGE FOLLOWING VASCULAR SURGERY
3998 CONTROL OF HEMORRHAGE NOS
4995 CONTROL OF (POSTOPERATIVE) HEMORRHAGE OF ANUS
5793 CONTROL OF (POSTOPERATIVE) HEMORRHAGE OF BLADDER
6094 CONTROL OF (POSTOPERATIVE) HEMORRHAGE OF PROSTATE

ICD-9-CM Drainage of Hematoma procedure codes:

1809 OTHER INCISION OF EXTERNAL EAR
540 INCISION OF ABDOMINAL WALL
5412 REOPENING OF RECENT LAPAROTOMY SITE
5919 OTHER INCISION OF PERIVESICLE TISSUE
610 INCISION AND DRAINAGE OF SCROTUM AND TUNICA AND VAGINALIS
6998 OTHER OPERATIONS ON SUPPORTING STRUCTURES OF UTERUS
7014 OTHER VAGINOTOMY
7109 OTHER INCISION OF VULVA AND PERINEUM
7591 EVACUATION OF OBSTETRICAL INCISIONAL HEMATOMA OF PERINEUM
7592 EVACUATION OF OTHER HEMATOMA OF VULVA OR VAGINA
8604 OTHER INCISION W/ DRAINAGE OF SKIN AND SUBCUTANEOUS TISSUE

Denominator:

All surgical discharges defined by specific DRGs and an ICD-9-CM code for an operating room procedure (Appendix C).

Surgical Discharge DRGs:

See PSI 1 **Complications of Anesthesia** for a list of surgical DRG codes.

Exclude:

Patients with ICD-9-CM codes for postoperative hemorrhage or postoperative hematoma in the principal diagnosis field

Patients where the only operating room procedure is postoperative control of hemorrhage or drainage of hematoma.

Patients where a procedure for postoperative control of hemorrhage or drainage of hematoma occurs before the first operating room procedure.

Note: If day of procedure is not available in the input data file, the rate may be slightly lower than if the information was available.

Obstetrical patients in MDC 14 (Pregnancy, Childbirth and the Puerperium).

Postoperative Physiologic and Metabolic Derangement (PSI 10)**Numerator:**

Discharges with ICD-9-CM codes for physiologic and metabolic derangements in any secondary diagnosis field.

Discharges with acute renal failure (subgroup of physiologic and metabolic derangements) must be accompanied by a procedure code for dialysis (39.95, 54.98).

Postoperative Physiologic and Metabolic Derangement (PSI 10)

ICD-9-CM Physiologic and Metabolic Derangements diagnosis codes:

Diabetes with ketoacidosis:

25010 TYPE 2, OR UNSPECIFIED TYPE, NOT STATED AS UNCONTROLLED
25011 TYPE 1 NOT STATED AS UNCONTROLLED
25012 TYPE 2, OR UNSPECIFIED TYPE, UNCONTROLLED
25013 TYPE 1 UNCONTROLLED

Acute renal failure:

5845 W/ LESION OF TUBULAR NECROSIS
5846 W/ LESION OF RENAL CORTICAL NECROSIS
5847 W/ LESION OF RENAL MEDULLARY [PAPILLARY] NECROSIS
5848 W/ OTHER SPECIFIED PATHOLOGICAL LESION IN KIDNEY
5849 ACUTE RENAL FAILURE, UNSPECIFIED

Diabetes with hyperosmolarity:

25020 TYPE 2, OR UNSPECIFIED TYPE, NOT STATED AS UNCONTROLLED
25021 TYPE 1 NOT STATED AS UNCONTROLLED
25022 TYPE 2, OR UNSPECIFIED TYPE, UNCONTROLLED
25023 TYPE 1 UNCONTROLLED

Diabetes with other coma:

25030 TYPE 2, OR UNSPECIFIED TYPE, NOT STATED AS UNCONTROLLED
25031 TYPE 1 NOT STATED AS UNCONTROLLED
25032 TYPE 2, OR UNSPECIFIED TYPE, UNCONTROLLED
25033 TYPE 1 UNCONTROLLED

Denominator:

All elective* surgical discharges defined by specific DRGs and an ICD-9-CM code for an operating room procedure (Appendix C).

Elective

Admission type # is recorded as elective (ATYPE = 3)

Surgical Discharge DRGs:

See PSI 1 **Complications of Anesthesia** for a list of surgical DRG codes.

Exclude:

Patients with ICD-9-CM codes for physiologic and metabolic derangements in the principal diagnosis field.

Patients with acute renal failure where a procedure for dialysis occurs before or on the same day as the first operating room procedure.

Note: If day of procedure is not available in the input data file, the rate may be slightly lower than if the information was available.

Patients with both a diagnosis code of ketoacidosis, hyperosmolarity, or other coma (subgroups of physiologic and metabolic derangements coding) and a principal diagnosis of diabetes.

Patients with both a secondary diagnosis code for acute renal failure (subgroup of physiologic and

Postoperative Physiologic and Metabolic Derangement (PSI 10)

metabolic derangements coding) and a principal diagnosis of acute myocardial infarction, cardiac arrhythmia, cardiac arrest, shock, hemorrhage, or gastrointestinal hemorrhage.

Obstetrical patients in MDC 14 (Pregnancy, Childbirth and the Puerperium).

ICD-9-CM Diabetes diagnosis codes (includes 4th and 5th digits):

2500	DIABETES MELLITUS W/O MENTION OF COMPLICATION
2501	DIABETES W/ KETOACIDOSIS
2502	DIABETES W/ HYPEROSMOLARITY
2503	DIABETES W/ OTHER COMA
2504	DIABETES W/ RENAL MANIFESTATIONS
2505	DIABETES W/ OPHTHALMIC MANIFESTATIONS
2506	DIABETES W/ NEUROLOGICAL MANIFESTATIONS
2507	DIABETES W/ PERIPHERAL CIRCULATORY DISORDERS
2508	DIABETES W/ OTHER SPECIFIED MANIFESTATIONS
2509	DIABETES W/ OTHER UNSPECIFIED COMPLICATIONS

ICD-9-CM Acute Myocardial Infarction diagnosis codes:

See FTR 1 **Acute Renal Failure** for a list of acute myocardial infarction diagnosis codes.

ICD-9-CM Cardiac Arrhythmia diagnosis codes:

See FTR 1 **Acute Renal Failure** for a list of cardiac arrhythmia diagnosis codes.

DRGs:

138	CARDIAC ARRHYTHMIA AND CONDUCTION DISORDERS W/ CC
139	CARDIAC ARRHYTHMIA AND CONDUCTION DISORDERS W/O CC

ICD-9-CM Cardiac Arrest diagnosis code:

See FTR 1 **Acute Renal Failure** for a list of cardiac arrest diagnosis codes.

ICD-9-CM Shock diagnosis codes:

See FTR 1 **Acute Renal Failure** for a list of shock diagnosis codes.

ICD-9-CM Hemorrhage diagnosis codes:

See FTR 1 **Acute Renal Failure** for a list of hemorrhage diagnosis codes.

ICD-9-CM Gastrointestinal (GI) Hemorrhage diagnosis codes:

See FTR 1 **Acute Renal Failure** for a list of GI hemorrhage diagnosis codes.

Postoperative Respiratory Failure (PSI 11)

Numerator:

Discharges with ICD-9-CM codes for acute respiratory failure (518.81) in any secondary diagnosis field. (After 1999, include 518.84).

Denominator:

All elective* surgical discharges defined by specific DRGs and an ICD-9-CM code for an operating room procedure (Appendix C).

Elective:

Admission type # is recorded as elective (ATYPE = 3).

Surgical Discharge DRGs:

See PSI 1 **Complications of Anesthesia** for a list of surgical DRG codes.

Exclude:

Patients with ICD-9-CM codes for acute respiratory failure in the principal diagnosis field.

Patients where a procedure for tracheostomy is the only operating room procedure.

Patients where a procedure for tracheostomy occurs before the first operating room procedure.

Note: If day of procedure is not available in the input data file, the rate may be slightly lower than if the information was available.

Patients with respiratory or circulatory diseases (MDC 4 and 5).

Obstetrical patients in MDC 14 (Pregnancy, Childbirth, and the Puerperium).

ICD-9-CM Tracheostomy procedure codes:

3121	MEDIASTINAL TRACHEOSTOMY
3129	OTHER PERM TRACHEOSTOMY
3174	REVISION OF TRACHEOSTOMY

Postoperative Pulmonary Embolism or Deep Vein Thrombosis (PSI 12)

Numerator:

Discharges with ICD-9-CM codes for deep vein thrombosis or pulmonary embolism in any secondary diagnosis field.

ICD-9-CM Deep Vein Thrombosis diagnosis codes:

45111	PHLEBITIS AND THROMBOSIS OF FEMORAL VEIN (DEEP) (SUPERFICIAL)
45119	PHLEBITIS AND THROMBOPHLEBITIS OF DEEP VESSEL OF LOWER EXTREMITIES – OTHER
4512	PHLEBITIS AND THROMBOPHLEBITIS OF LOWER EXTREMITIES UNSPECIFIED
45181	PHLEBITIS AND THROMBOPHLEBITIS OF ILIAC VEIN
4519	PHLEBITIS AND THROMBOPHLEBITIS OF OTHER SITES - OF UNSPECIFIED SITE
45340	DVT-EMBLSM LOWER EXT NOS (OCT 04)
45341	DVT-EMB PROX LOWER EXT (OCT 04)
45342	DVT-EMB DISTAL LOWER EXT (OCT 04)
4538	OTHER VENOUS EMBOLISM AND THROMBOSIS OF OTHER SPECIFIED VEINS

Postoperative Pulmonary Embolism or Deep Vein Thrombosis (PSI 12)

4539 OTHER VENOUS EMBOLISM AND THROMBOSIS OF UNSPECIFIED SITE

ICD-9-CM Pulmonary Embolism diagnosis codes:

4151 PULMONARY EMBOLISM AND INFARCTION
41511 IATROGENIC PULMONARY EMBOLISM AND INFARCTION
41519 PULMONARY EMBOLISM AND INFARCTION, OTHER

Denominator:

All surgical discharges defined by specific DRGs and an ICD-9-CM code for an operating room procedure (Appendix C).

Surgical Discharge DRGs:

See PSI 1 **Complications of Anesthesia** for a list of surgical DRG codes.

Exclude:

Patients with ICD-9-CM codes for deep vein thrombosis or pulmonary embolism in the principal diagnosis field.

Patients where a procedure for interruption of vena cava is the only operating room procedure

Patients where a procedure for interruption of vena cava occurs before or on the same day as the first operating room procedure.

Note: If day of procedure is not available in the input data file, the rate may be slightly lower than if the information was available.

Obstetrical patients in MDC 14 (Pregnancy, Childbirth and the Puerperium).

ICD-9-CM Interruption Of Vena Cava procedure code:

387 INTERRUPTION OF VENA CAVA

Postoperative Sepsis (PSI 13)

Numerator:

Discharges with ICD-9-CM code for sepsis in any secondary diagnosis field.

ICD-9-CM Sepsis diagnosis codes:

0380 STREPTOCOCCAL SEPTICEMIA
0381 STAPHYLOCOCCAL SEPTICEMIA
03810 STAPHYLOCOCCAL SEPTICEMIA, UNSPECIFIED
03811 STAPHYLOCOCCUS AUREUS SEPTICEMIA
03819 OTHER STAPHYLOCOCCAL SEPTICEMIA
0382 PNEUMOCOCCAL SEPTICEMIA (STREPTOCOCCUS PNEUMONIAE SEPTICEMIA)
0383 SEPTICEMIA DUE TO ANAEROBES

Septicemia due to:

03840 GRAM-NEGATIVE ORGANISM, UNSPECIFIED
03841 HEMOPHILUS INFLUENZAE
03842 ESCHERICHIA COLI
03843 PSEUDOMONAS
03844 SERRATIA

Postoperative Sepsis (PSI 13)

03849	SEPTICEMIA DUE TO OTHER GRAM-NEGATIVE ORGANISMS
0388	OTHER SPECIFIED SEPTICEMIAS
0389	UNSPECIFIED SEPTICEMIA
99591	SYSTEMIC INFLAMMATORY RESPONSE SYNDROME DUE TO INFECTIOUS PROCESS W/O ORGAN DYSFUNCTION
99592	SYSTEMIC INFLAMMATORY RESPONSE SYNDROME DUE TO INFECTIOUS PROCESS W/ ORGAN DYSFUNCTION

Denominator:

All elective* surgical defined by specific DRGs and an ICD-9-CM code for an operating room procedure (Appendix C).

Surgical Discharge DRGs:

See PSI 1 **Complications of Anesthesia** for a list of surgical DRG codes.

Elective:

Admission type # is recorded as elective (ATYPE = 3)

Exclude:

Patients with ICD-9-CM codes for sepsis in the principal diagnosis field,

Patients with a principal diagnosis of infection, or any code for immunocompromised state, or cancer.

Obstetrical patients in MDC 14 (Pregnancy, Childbirth and the Puerperium).

Include only patients with a length of stay of 4 or more days.

ICD-9-CM Infection diagnosis codes:

See FTR 4 **Sepsis** for a list of infection diagnosis codes.

Infection DRGs:

See FTR 4 **Sepsis** for a list of infection DRG codes.

ICD-9-CM Immunocompromised States diagnosis codes:

See PSI 2 **Death in Low Mortality DRGs** for a list of immunocompromised state diagnosis codes.

ICD-9-CM Immunocompromised States procedure codes:

See PSI 2 **Death in Low Mortality DRGs** for a list of immunocompromised state procedure codes.

ICD-9-CM Cancer diagnosis codes (includes 4th and 5th digits):

See PSI 2 **Death in Low Mortality DRGs** for a list of cancer diagnosis codes.

Cancer DRGs:

See PSI 7 **Infection due to Medical Care** for a list of cancer DRG codes.

Postoperative Wound Dehiscence, Secondary Diagnosis Field (PSI 14 and 24))**Numerator:**

Discharges with ICD-9-CM code for reclosure of postoperative disruption of abdominal wall (54.61) in any procedure field.

Denominator:

All abdominopelvic surgical discharges.

Exclude:

Patients where a procedure for reclosure of postoperative disruption of abdominal wall occurs before or on the same day as the first abdominopelvic surgery procedure.

Note: If day of procedure is not available in the input data file, the rate may be slightly lower than if the information was available

Obstetrical patients in MDC 14 (Pregnancy, Childbirth, and the Puerperium).

ICD-9-CM Abdominopelvic procedure codes:

3804 INCISION OF AORTA
3806 INCISION OF ABDOMINAL ARTERIES
3807 INCISION OF ABDOMINAL VEINS
3814 ENDARTERECTOMY OF AORTA
3816 ENDARTERECTOMY OF ABDOMINAL ARTERIES
3834 RESECTION OF AORTA W/ ANASTOMOSIS
3836 RESECTION OF ABDOMINAL ARTERIES W/ ANASTOMOSIS
3837 RESECTION OF ABDOMINAL VEINS W/ ANASTOMOSIS
3844 RESECTION OF AORTA, ABDOMINAL W/ REPLACEMENT
3846 RESECTION OF ABDOMINAL ARTERIES W/ REPLACEMENT
3847 RESECTION OF ABDOMINAL VEINS W/ REPLACEMENT
3857 LIGATION AND STRIPPING OF VARICOSE VEINS, ABDOMINAL VEINS
3864 OTHER EXCISION OF AORTA, ABDOMINAL
3866 OTHER EXCISION OF ABDOMINAL ARTERIES
3867 OTHER EXCISION OF ABDOMINAL VEINS
3884 OTHER SURGICAL OCCLUSION OF AORTA, ABDOMINAL
3886 OTHER SURGICAL OCCLUSION OF ABDOMINAL ARTERIES
3887 OTHER SURGICAL OCCLUSION OF ABDOMINAL VEINS
391 INTRA-ABDOMINAL VENOUS SHUNT
3924 AORTA-RENAL BYPASS
3925 AORTA-ILIAC-FEMORAL BYPASS
3926 OTHER INTRA-ABDOMINAL VASCULAR SHUNT OR BYPASS
4052 RADICAL EXCISION OF PERIAORTIC LYMPH NODES
4053 RADICAL EXCISION OF ILIAC LYMPH NODES
412 SPLENOTOMY
4133 OPEN BIOPSY OF SPLEEN
4141 MARSUPIALIZATION OF SPLENIC CYST
4142 EXCISION OF LESION OR TISSUE OF SPLEEN
4143 PARTIAL SPLENECTOMY
415 TOTAL SPLENECTOMY
4193 EXCISION OF ACCESSORY SPLEEN
4194 TRANSPLANTATION OF SPLEEN
4195 REPAIR AND PLASTIC OPERATIONS ON SPLEEN
4199 OTHER OPERATIONS ON SPLEEN
4240 ESOPHAGECTOMY, NOS
4241 PARTIAL ESOPHAGECTOMY
4242 TOTAL ESOPHAGECTOMY
4253 INTRATHORACIC ESOPHAGEAL ANASTOMOSIS W/ INTERPOSITION OF SMALL BOWEL
4254 OTHER INTRATHORACIC ESOPHAGOENTEROSTOMY

Postoperative Wound Dehiscence, Secondary Diagnosis Field (PSI 14 and 24))

4255	INTRATHORACIC ESOPHAGEAL ANASTOMOSIS W/ INTERPOSITION OF COLON
4256	OTHER INTRATHORACIC ESOPHAGOCOLOSTOMY
4263	ANTESTERNAL ESOPHAGEAL ANASTOMOSIS W/ INTERPOSITION OF SMALL BOWEL
4264	OTHER ANTESTERNAL ESOPHAGOENTEROSTOMY
4265	ANTESTERNAL ESOPHAGEAL ANASTOMOSIS W/ INTERPOSITION OF COLON
4266	OTHER ANTESTERNAL ESOPHAGOCOLOSTOMY
4291	LIGATION OF ESOPHAGEAL VARICES
430	GASTROTOMY
433	PYLOROMYOTOMY
4342	LOCAL EXCISION OF OTHER LESION OR TISSUE OF STOMACH
4349	OTHER DESTRUCTION OF LESION OR TISSUE OF STOMACH
435	PARTIAL GASTRECTOMY W/ ANASTOMOSIS TO ESOPHAGUS
436	PARTIAL GASTRECTOMY W/ ANASTOMOSIS TO DUODENUM
437	PARTIAL GASTRECTOMY W/ ANASTOMOSIS TO JEJUNUM
4381	PARTIAL GASTRECTOMY W/ JEJUNA TRANSPOSITION
4389	OTHER PARTIAL GASTRECTOMY
4391	TOTAL GASTRECTOMY W/ INTESTINAL INTERPOSITION
4399	OTHER TOTAL GASTRECTOMY
4400	VAGOTOMY, NOS
4401	TRUNCAL VAGOTOMY
4402	HIGHLY SELECTIVE VAGOTOMY
4403	OTHER SELECTIVE VAGOTOMY
4411	TRANSABDOMINAL GASTROSCOPY
4415	OPEN BIOPSY OF STOMACH

6632	OTHER BILATERAL LIGATION AND DIVISION OF FALLOPIAN TUBES
6639	OTHER BILATERAL DESTRUCTION OR OCCLUSION OF FALLOPIAN TUBES
664	TOTAL UNILATERAL SALPINGECTOMY
6651	REMOVAL OF BOTH FALLOPIAN TUBES AT SAME OPERATIVE EPISODE
6652	REMOVAL OF REMAINING FALLOPIAN TUBE
6661	EXCISION OR DESTRUCTION OF LESION OF FALLOPIAN TUBE
6662	SALPINGECTOMY W/ REMOVAL OF TUBAL PREGNANCY
6663	BILATERAL PARTIAL SALPINGECTOMY, NOS
6669	OTHER PARTIAL SALPINGECTOMY
6671	SIMPLE SUTURE OF FALLOPIAN TUBE
6672	SALPINGO-OOPHOROSTOMY
6673	SALPINGO-SALPINGOSTOMY
6674	SALPINGO-UTEROSTOMY
6679	OTHER REPAIR OF FALLOPIAN TUBE

Postoperative Wound Dehiscence, Secondary Diagnosis Field (PSI 14 and 24))

6692 UNILATERAL DESTRUCTION OR OCCLUSION OF FALLOPIAN TUBE
6697 BURYING OF FIMBRIAE IN UTERINE WALL
680 OTHER INCISION AND EXCISION OF UTERUS
6813 OPEN BIOPSY OF UTERUS
6814 OPEN BIOPSY OF UTERINE LIGAMENTS
683 SUBTOTAL ABDOMINAL HYSTERECTOMY
6839 OTHER SUBTOTAL ABDOMINAL HYSTERECTOMY
684 TOTAL ABDOMINAL HYSTERECTOMY
686 RADICAL ABDOMINAL HYSTERECTOMY
688 PELVIC EVISCERATION
6922 OTHER UTERINE SUSPENSION
693 PARACERVICAL UTERINE DENERVATION
6941 SUTURE OF LACERATION OF UTERUS
6942 CLOSURE OF FISTULA OF UTERUS
6949 OTHER REPAIR OF UTERUS

** only for discharges occurring on or after October 1, 2004

Accidental Puncture or Laceration, Secondary Diagnosis Field (PSI 15 and 25)**Numerator:**

Discharges with ICD-9-CM code denoting accidental cut, puncture, perforation or laceration during a procedure in any secondary diagnosis field.

ICD-9-CM Accidental Puncture or Laceration diagnosis codes:

Accidental cut, puncture, perforation, or hemorrhage during medical care:

E8700 SURGICAL OPERATION
E8701 INFUSION OR TRANSFUSION
E8702 KIDNEY DIALYSIS OR OTHER PERFUSION
E8703 INJECTION OR VACCINATION
E8704 ENDOSCOPIC EXAMINATION
E8705 ASPIRATION OF FLUID OR TISSUE, PUNCTURE, AND CATHETERIZATION
E8706 HEART CATHETERIZATION
E8707 ADMINISTRATION OF ENEMA
E8708 OTHER SPECIFIED MEDICAL CARE
E8709 UNSPECIFIED MEDICAL CARE

9982 ACCIDENTAL PUNCTURE OR LACERATION DURING A PROCEDURE

Denominator:

All medical and surgical discharges defined by specific DRGs.

Surgical Discharge DRGs:

See PSI 1 **Complications of Anesthesia** for a list of surgical DRG codes.

Medical Discharge DRGs:

See PSI 3 **Decubitus Ulcer** for a list of medical DRG codes.

Exclude:

Patients with ICD-9-CM code denoting technical difficulty (e.g., accidental cut, puncture, perforation, or laceration) in the principal diagnosis field

Obstetrical patients in MDC 14 (Pregnancy, Childbirth and the Puerperium).

Transfusion Reaction, Secondary Diagnosis Field (PSI 16 and 26)

Numerator:

Discharges with ICD-9-CM codes for transfusion reaction in any secondary diagnosis field.

ICD-9-CM Transfusion Reaction diagnosis codes:

9996 ABO INCOMPATIBILITY REACTION
9997 RH INCOMPATIBILITY REACTION
E8760 MISMATCHED BLOOD IN TRANSFUSION

Denominator:

All medical and surgical discharges defined by specific DRGs.

Surgical Discharge DRGs:

See PSI 1 **Complications of Anesthesia** for a list of surgical DRG codes.

Medical Discharge DRGs:

See PSI 3 **Decubitus Ulcer** for a list of medical DRG codes.

Exclude:

Patients with ICD-9-CM code for transfusion reaction in the principal diagnosis field

Birth Trauma—Injury to Neonate (PSI 17)

Numerator:

Discharges with ICD-9-CM codes for birth trauma in any diagnosis field.

ICD-9-CM Birth Trauma diagnosis codes:

7670 SUBDURAL AND CEREBRAL HEMORRHAGE (DUE TO TRAUMA OR TO INTRAPARTUM ANOXIA OR HYPOXIA)
76711 EPICRANIAL SUBAPONEUROTIC HEMORRHAGE (MASSIVE) (OCT 03)
7673 INJURIES TO SKELETON (EXCLUDES CLAVICLE)
7674 INJURY TO SPINE AND SPINAL CORD
7677 OTHER CRANIAL AND PERIPHERAL NERVE INJURIES
7678 OTHER SPECIFIED BIRTH TRAUMA
7679 BIRTH TRAUMA, UNSPECIFIED

Note: Because 767.1 was not previously included in the numerator specification, the addition of 767.11 may cause an increase in the rate.

Exclude:

Infants with a subdural or cerebral hemorrhage (subgroup of birth trauma coding) **and** any diagnosis code of pre-term infant (denoting birth weight of less than 2,500 grams and less than 37 weeks gestation or 34 weeks gestation or less).

Infants with injury to skeleton (767.3, 767.4) **and** any diagnosis code of osteogenesis imperfecta (756.51).

Birth Trauma—Injury to Neonate (PSI 17)

ICD-9-CM Preterm Infant diagnosis codes:

76501	EXTREME IMMATURITY, LESS THAN 500 GRAMS
76502	EXTREME IMMATURITY, 500 – 749 GRAMS
76503	EXTREME IMMATURITY, 750 – 999 GRAMS
76504	EXTREME IMMATURITY, 1000 – 1249 GRAMS
76505	EXTREME IMMATURITY, 1250 – 1499 GRAMS
76506	EXTREME IMMATURITY, 1500 – 1749 GRAMS
76507	EXTREME IMMATURITY, 1750 – 1999 GRAMS
76508	EXTREME IMMATURITY, 2000 – 2499 GRAMS
76511	OTHER PRETERM INFANTS, LESS THAN 500 GRAMS
76512	OTHER PRETERM INFANTS, 500 – 749 GRAMS
76513	OTHER PRETERM INFANTS, 750 – 999 GRAMS
76514	OTHER PRETERM INFANTS, 1000 – 1249 GRAMS
76515	OTHER PRETERM INFANTS, 1250 – 1499 GRAMS
76516	OTHER PRETERM INFANTS, 1500 – 1749 GRAMS
76517	OTHER PRETERM INFANTS, 1750 – 1999 GRAMS
76518	OTHER PRETERM INFANTS, 2000 – 2499 GRAMS
76521	LESS THAN 24 COMPLETED WEEKS OF GESTATION
76522	24 COMPLETED WEEKS OF GESTATION
76523	25-26 COMPLETED WEEKS OF GESTATION
76524	27-28 COMPLETED WEEKS OF GESTATION
76525	29-30 COMPLETED WEEKS OF GESTATION
76526	31-32 COMPLETED WEEKS OF GESTATION
76527	33-34 COMPLETED WEEKS OF GESTATION

Denominator:

All liveborn births.

Admission type recorded as (4):

AND

Liveborn DRGs:

385	NEONATES, DIED OR TRANSFERRED TO ANOTHER ACUTE CARE FACILITY
386	EXTREME IMMATURITY OR RESPIRATORY DISTRESS SYNDROME OF NEONATE
387	PREMATURITY W/ MAJOR PROBLEMS
388	PREMATURITY W/O MAJOR PROBLEMS
389	FULL TERM NEONATE W/ MAJOR PROBLEMS
390	NEONATE W/ OTHER SIGNIFICANT PROBLEMS
391	NORMAL NEWBORN

OR

ICD-9-CM Liveborn diagnosis codes (includes 4th and 5th digits):*

764	SLOW FETAL GROWTH AND FETAL MALNUTRITION
765	DISORDERS RELATING TO SHORT GESTATION AND UNSPECIFIED LOW BIRTH WEIGHT
766	DISORDERS RELATING TO LONG GESTATION AND HIGH BIRTH WEIGHT
76621	POST-TERM INFANT (OCT 03)
76622	PROLONGED GESTATION - INFANT (OCT 03)
767	BIRTH TRAUMA
76711	EPICRANIAL SUBAPONEUROTIC HEMORRHAGE (MASSIVE) (OCT 03)
76719	OTHER INJURIES TO SCALP (OCT 03)
768	INTRAUTERINE HYPOXIA AND BIRTH ASPHYXIA

Birth Trauma—Injury to Neonate (PSI 17)

769	RESPIRATORY DISTRESS SYNDROME
770	OTHER RESPIRATORY CONDITIONS OF FETUS AND NEWBORN
77081	PRIMARY APNEA OF NEWBORN (OCT 02)
77082	OTHER APNEA OF NEWBORN (OCT 02)

7561	REPAIR OF CURRENT OBSTETRIC LACERATION OF BLADDER AND URETHRA
7562	REPAIR OF CURRENT OBSTETRIC LACERATION OF RECTUM AND SPHINCTER ANI

Denominator:

All cesarean delivery discharges.

Cesarean Delivery DRGs:

370	CESAREAN SECTION W/ CC
371	CESAREAN SECTION W/OCC

Appendix B: Detailed Methods

Empirical analyses were conducted to provide additional information about the indicators. These analyses were intended not as decision making tools, but rather explorations into the characteristics of the indicators. Specifically, these analyses explore the frequency and variation of the indicators, the potential bias, based on limited risk adjustment, and the relationship between indicators.

Analysis Approach

Data sources. The data sources used in the empirical analyses were the 1997 Florida State Inpatient Database (SID) (for initial testing and development; 1995-1997 used for persistence analysis) and the 1997 State Inpatient Databases (SID) for 19 HCUP participating States, referred to in this report as the National SID (for the final empirical analysis). The Florida SID consists of about 2 million discharges from over 200 hospitals, and was chosen because Florida is a large diverse State. The National SID consists of about 19 million discharges from over 2,300 hospitals. The National SID contains all-payer data on hospital inpatient stays from participating States (Arizona, California, Colorado, Connecticut, Florida, Illinois, Iowa, Kansas, Maryland, Massachusetts, Missouri, New Jersey, New York, Oregon, Pennsylvania, South Carolina, Tennessee, Washington, and Wisconsin). All discharges from participating States' community hospitals are included in the SID database, which defines community hospitals as non-Federal, short-term, general, and other specialty hospitals, excluding long-term hospitals and hospital units of long-term care institutions, psychiatric hospitals, and alcoholism and chemical dependency treatment facilities.

A complete description of the content of the SID, including details of the participating States' discharge abstracts, can be found on the Agency for Healthcare Research and Quality Web site (<http://www.hcup-us.ahrq.gov/sidoverview.jsp>). Because the Florida SID was used only for initial testing and development, the empirical results reported are from the National SID. Descriptive results from the Florida SID are reported for comparison to ensure that the hospital-level results were similar in both data sources. Differences between Florida and national results are pointed out in the text. The National SID data were also used for the construction of area measures, with data from the U.S. Census Bureau used to construct the denominator of these rates.

Reported patient safety indicators. Three sets of patient safety indicators were examined. First, the Accepted patient safety indicators met the face validity criteria established through the literature review and clinician panel review. Second, the Experimental patient safety indicators did not meet those criteria, but appeared to warrant further testing and evaluation. Third, several Accepted patient safety indicators were modified into *area* indicators, which were designed to assess the total incidence of the adverse event within geographic areas. For example, the project team constructed an indicator for "Transfusion reaction" at both the hospital and area levels. Transfusion reactions that occur after discharge from a hospitalization would result in a readmission. The area-level indicator includes these cases, while the provider level restricts the number of transfusion reactions to only those that occur during the same hospitalization that exposed the patient to this risk.

All potential indicators were examined empirically by developing and conducting statistical tests for precision, bias, and relatedness of indicators. For each indicator, the project team calculated five different estimates of provider level performance:

1. The raw indicator rate was calculated using the number of adverse events in the numerator divided by the number of discharges in the population at risk by hospital. For the area indicators, the denominator is the population of the Metropolitan Statistical Area (MSA), New England County Metropolitan Area (for the New England States) or county (for non-MSA areas) of the hospital.
2. The raw indicator was adjusted using a logistic regression to account for differences among hospitals (and areas) in demographics (specifically, age and gender). Age was modeled using a set of dummy

variables to represent 10-year categories except for young children, whose age categories are narrower (i.e., less than 1, 1-4, 5-14, 15-24, 25-34, 35-44, 45-54, 55-64, 65-74, 75-84, and 85 or more years), along with a parallel set of age-gender interactions. Because of sparse cells, certain age categories were combined or omitted for selected indicators, such as the obstetric indicators.

3. The raw indicator was adjusted to account for differences among hospitals in age, gender and modified DRG category (as described below).
4. The raw indicator was adjusted to account for differences among hospitals in age, gender, modified DRG, and comorbidities (defined using an adaptation of the AHRQ comorbidity software) of patients.
5. Multivariate signal extraction (MSX) methods were applied to adjust for reliability by estimating the amount of “noise” (i.e., variation due to random error) relative to the amount of “signal” (i.e., systematic variation in hospital performance or the ‘reliability’) for each indicator. This or similar “reliability adjustment” has been used in the literature for similar purposes.^{136 137} Multivariate methods (taking into account correlations among indicators to extract additional signal) were applied to most of the accepted indicators. The exceptions were Death in Low Mortality DRGs and Failure to Rescue. Only univariate signal extraction methods (smoothing) were applied to these two indicators and to the experimental indicators, because these indicators possibly cover broader clinical concepts. Correlations between these indicators and other indicators may not reflect correlations due to quality of care, and thus inclusion of these indicators may adversely affect the MSX approximations.

For additional details on the empirical methods, refer to the companion EPC HCUP Quality Indicator Report, published by AHRQ (<http://www.qualityindicators.ahrq.gov/downloads.htm>). Additional details on the modifications made to the DRG and comorbidity categories are described below.

Hospital Fixed Effects. In the risk-adjustment models, hospital fixed effects were calculated using the standard method with logistic models of first estimating the predicted value for each discharge, then subtracting the actual outcome from the predicted, and averaging the difference for each hospital to get the hospital fixed effect estimate. In the Quality Indicator Report,¹³⁸ linear regression models were used with hospital fixed effects included, arguing that the logistic approach yielded biased estimates due to the omission of a variable (the hospital) correlated with both the dependent (e.g., in-hospital mortality) and the independent (e.g., age, gender, APR-DRG) variables in the model. Given the rare occurrence of many of the PSIs, however, the logistic approach may be more appropriate for this application. Linear methods assume that the error term is normally distributed. This assumption is violated when the outcome is dichotomous.

The QI means were generally an order of magnitude higher than the PSI means, so the assumption was not as problematic. However, the most appropriate method depends on the particular characteristics of each indicator, whether QI or PSI. To the extent that bias is a concern, accounting for the clustering of patients by using a hospital fixed effect is advantageous. To the extent that extreme values are a concern, imposing structure on the error term with logistic methods is advantageous. In the end, the two approaches can be compared in terms of how much difference it makes in the relative assessment of provider performance. This issue warrants further analysis to better understand the trade-offs and limitations of each approach, and under what conditions and for what indicators each approach might best apply.

Specifically, the risk-adjusted “raw” estimate of a hospital’s performance is constructed in two steps. In the first step, if it is denoted whether or not the event associated with a particular indicator Y^k ($k=1,\dots,K$) was observed for a particular patient i in year t ($t=1,\dots,T$), then the regression to construct a

¹³⁶ Hofer TP, Hayward RA, Greenfield S, Wagner EH, Kaplan SH, Manning WG. The unreliability of individual physician “report cards” for assessing the costs and quality of care of a chronic disease JAMA 1999;28(22):2098-105.

¹³⁷ Christiansen CL, Morris CN. Improving the statistical approach to health care provider profiling. Ann Intern Med 1997;127(8 Pt 2):764-8).

¹³⁸ Davis et al. 2001.

risk-adjusted “raw” estimate of a particular patient’s performance on each indicator can be written as:

$$(1) \quad Y_{it}^k = Z_{it} \Pi_t^k + \xi_{it}^k, \quad \text{where}$$

Y_{it}^k is the k^{th} PSI for patient i in year t (i.e., whether or not the event associated with the indicator occurred on that discharge).

Z_{it} is a vector of patient covariates for patient i in year t (i.e., the patient-level measures used as risk adjusters).

Π_t^k is a vector of parameters in each year t , giving the effect of each patient risk adjuster on indicator k (i.e., the magnitude of the risk adjustment associated with each patient measure).

ξ_{it}^k is the unexplained residual in this patient-level model.

In the second step, the hospital effect was estimated by subtracting the resulting predictions from this patient-level regression from the actual observed patient-level outcomes, and taking the mean of this difference for each hospital. That is, for each hospital j ($j=1, \dots, J$),

$$(2) \quad M_{jt}^k = Y_{ijt}^k - (Z_{it} \Pi_t^k + \xi_{it}^k), \quad \text{where}$$

M_{jt}^k is the “raw” adjusted measure for indicator k for hospital j in year t (i.e., the hospital “fixed effect” in the patient-level regression).

Z_{it} is the vector of patient covariates for patient i in year t estimated in Step 1.

In addition to age, sex, and age*sex interactions as adjusters in the model, the project team also included a modified DRG and comorbidity category for the admission.

Modified DRG Categories. Two modifications were made to the Centers for Medicare and Medicaid Services (CMS, formerly Health Care Financing Administration) DRGs. First, adjacent DRG categories that were separated by the presence or absence of comorbidities or complications were collapsed. For example, DRGs 076 (Other Resp System Operating Room Procedures w CC) and 077 (Other Resp System Operating Room Procedures w/o CC) were grouped into one category. The purpose was to avoid adjusting for the complication the team was trying to measure. Second, most of the super-MDC DRG categories were excluded from the logistic models. Excluding these categories also avoids adjusting for the complications the team was trying to measure. For example, tracheostomies (DRG 482-483) often result from potentially preventable respiratory complications that require long-term mechanical ventilation. Similarly, operating room procedures unrelated to the principal diagnosis (DRG 468, 477) often result from potentially preventable complications that require surgical repair (i.e., fractures, lacerations).

In the companion technical report on quality indicators, the risk adjustment method implemented All Patient Refined (APR)-DRGs, a refinement of DRGs to capture different levels of complications. However, patient safety indicators, designed to detect potentially preventable complications, require a risk adjustment approach that does not inherently remove the differences between patients based on their complications. The APR-DRGs could be modified to remove applicable complications, on an indicator-by-indicator basis, but implementation of such an approach was beyond the scope of the current project. In this report, APR-DRG risk adjustment was not implemented.

Modified Comorbidity Software. To adjust for comorbidities, the project team used an updated adaptation of AHRQ Comorbidity Software (<http://www.hcup-us.ahrq.gov/toolssoftware/comorbidity/comorbidity.jsp>). The ICD-9-CM codes used to define the comorbidity categories were modified to address four main issues.

1. Comorbidity categories were excluded in the current software that include conditions likely to represent potentially preventable complications in certain settings, such as after elective surgery.

Specifically, three DRG categories (cardiac arrhythmia, coagulopathy, and fluid/electrolyte disorders) were removed from the comorbidity adjustment.

2. Most adaptations were designed to capture acute sequelae of chronic comorbidities, where both conditions are represented by a single ICD-9-CM code. For example, the definition of hypertension was broadened to include malignant hypertension, which usually arises in the setting of chronic hypertension. Unless these "acute on chronic" comorbidities are captured, some patients with especially severe comorbidities would be mislabeled as not having conditions of interest.
3. The comorbidity definitions did not include obstetric comorbidity codes, which are relevant for the obstetric indicators. Codes, when available, for these comorbidities in obstetric patients were added.
4. Slight updating was necessary based on recent ICD-9-CM code changes.

Low Mortality DRGs. In order to be included in the "Low Mortality DRG" indicator, the DRG had to have an overall in-hospital mortality rate (based on the National SID sample) of less than 0.5%. In addition, if a DRG category was split based on the presence of comorbidities or complications, then the category was included only if both DRGs (with and without comorbidities or complications) met the mortality threshold. Otherwise, the category was not included in the "Low mortality DRG" PSI. The indicator is reported as a single measure and stratified into medical (adult and pediatric), surgical (adult and pediatric), neonatal, obstetric and psychiatric DRGs.

Empirical Analysis Statistics

Using these methods, the project team constructed a set of statistical tests to examine precision, bias, and relatedness of indicators for all accepted hospital-level indicators, and precision and bias for all accepted area-level and experimental indicators. Each of the key statistical test results was summarized and explained in the overview section of the companion HCUP Quality Indicator report.¹³⁹ Tables B-1 through B-3 provide a summary of the statistical analyses and their interpretation.

¹³⁹ Davies et al., 2001.

Table B-1. Precision Tests

Measure	Statistic/Adjustments		Interpretation
Precision. Is most of the variation in an indicator at the level of the hospital? Do smoothed estimates of quality lead to more precise measures?			
a. Observed variation in indicator	Hospital-Level Standard Deviation Hospital -Level Skew Statistic	Unadjusted Age-gender adjusted Modified DRG adjusted Modified AHRQ comorbidity adjusted	Risk adjustment can either increase or decrease observed variation. If increase, then differences in patient characteristics mask provider differences. If decrease, then differences in patient characteristics account for provider differences.
b. MSX methods	Signal Standard Deviation Signal Share Signal Ratio	Reliability adjusted	Estimates what percentage of the observed variation between hospitals reflects systematic differences versus random noise. Signal share is a measure of how much of the total variation (patient and provider) is potentially subject to hospital control.

Table B-2. Bias Tests

Measure	Statistic	Interpretation
Bias. Does risk adjustment change our assessment of relative hospital performance, after accounting for reliability? Is the impact greatest among the best or worst performers, or overall? What is the magnitude of the change in performance?		
MSX methods: unadjusted vs. age, sex, modified DRG, comorbidity risk adjustment	Spearman Rank Correlation Coefficient (before and after risk adjustment)	Risk adjustment matters to the extent that it alters the assessment of relative hospital performance. This test determines the impact overall.
	Average absolute value of change relative to mean (after risk adjustment)	This test determines whether the absolute change in performance was large or small relative to the overall mean.
	Percentage of the top 10% of hospitals that remains the same (after risk adjustment)	This test measures the impact at the highest rates (in general, the worse performers).
	Percentage of the bottom 10% of hospitals that remains the same (after risk adjustment)	This test measures the impact at the lowest rates (in general, the better performers).
	Percentage of hospitals that move more than two deciles in rank (up or down) (after risk adjustment)	This test determines the magnitude of the relative changes.

Table B-3. Relatedness Tests

Measure	Statistic	Interpretation
Relatedness of indicators. Is the indicator related to other indicators in a way that makes clinical sense? Do methods that remove noise and bias make the relationship clearer?		
a. Correlation of indicator with other indicators	Spearman correlation coefficient	Are indicators correlated with other indicators in the direction one might expect?
b. Factor loadings of indicator	Factor loadings, based on Spearman correlation, Principal Component Analysis	Do indicators load on factors with other indicators that one might expect?

Appendix C: Log of Revisions to PSI Documentation and Software Version 2.1, Revision 3

The following table summarizes the revisions made to the PSI software, software documentation and the Guide to Patient Safety Indicators (Guide) document in release version 2.1, revision 3. The table lists the component(s) affected by the change and a short summary of the changes that were made.

Component	Changes
Software Documentation (SAS and SPSS) and Guide	Modified documentation to reflect changes in indicators associated with ICD-9-CM coding updates for FY 2005 (effective 10-1-2004). See separate documentation on ICD-9 coding updates for specific details. ¹⁴⁰
Guide	<ol style="list-style-type: none"> 1. Updated the provider, area and population rates in Table 1 and Table 2 and the detailed evidence section using data from the 2002 HCUP SID files. 2. In the detailed evidence section, added a cross reference from each indicator description to the indicator's detailed definition in Appendix A. 3. Included Appendix A titles of detailed definitions in the Table of Contents. 4. Removed the Operating Room Procedure Codes from Appendix C and reorganized the Appendices. The Operating Room Procedure Codes are now provided as a separate downloadable document.¹⁴¹
Software (SAS and SPSS)	<ol style="list-style-type: none"> 1. Added the 2003 census data (i.e., QICTY03.TXT) 2. Added optional data elements YEAR (year of patient discharge) and DQTR (calendar quarter of patient discharge) to the specifications of the input file. 3. Added new user control parameter YEARQTR to CONTROL_PSI.SAS and PSSPS1.SPS. The default setting for this parameter in the syntax is 0. If the data elements YEAR and DQTR are available in the input data file the parameter would be set to 1. <p>Note: If available, these data elements are used to implement a coding change to Postoperative Wound Dehiscence (PSI #14) that adds ICD-9-CM code 44.99 to the denominator for discharges occurring on or after 10/1/2004. However, ICD-9 code 44.99 will not be retained in the denominator if the data elements year and quarter of discharge are not available or if the user selects the option not to retain code 44.99 for purposes of trending over time.</p>

<i>Component</i>	<i>Changes</i>
Software Documentation (SAS and SPSS)	<ol style="list-style-type: none"> 1. Table 3 was amended to include the 2003 census data (i.e., QICTY03.TXT). 2. Added instructions for setting new user control parameter YEARQTR to CONTROL_PSI.SAS and PSSPS1.SPS. 3. Added descriptions of optional data elements YEAR (year of patient discharge) and DQTR (calendar quarter of patient discharge) to Table 4.

Appendix D: ICD-9-CM and DRG Coding Updates in PSI Release Version 2.1, Revision 3

The following changes were implemented in version 2.1, Revision 3 of the Patient Safety Indicator PSI software code (both SAS and SPSS) and reflect changes to indicator definitions based on updates to ICD-9-CM and DRG codes for Fiscal Year 2005 (effective 10-1-2004). All changes noted below have been incorporated into the software syntax, software documentation and the Guide to Patient Safety Indicators. With this software update, the PSI software definitions now incorporate ICD-9-CM codes valid from October 1, 1994 through September 30, 2005.

Indicator Name (#)	Component	Change
Decubitus Ulcer (PSI #3)	Numerator (inclusion, decubitus ulcer)	Added new (FY2005) codes 707.00 "unspecified site", 707.01 "elbow", 707.02 "upper back", 707.03 "lower back", 707.04 "hip", 707.05 "buttock", 707.06 "ankle", 707.07 "heel" and 707.09 "site, other" to the numerator inclusion criteria for decubitus ulcer. Expected impact on rate: negligible.
Failure to Rescue (PSI #4)	Denominator (inclusion, DVT/PE)	Added new (FY2005) codes 453.40 "unspecified site", 453.41 "proximal" and 453.42 "distal" to the denominator inclusion criteria for venous embolism and thrombosis of deep vessels of the lower extremity. Expected impact on rate: negligible.
Postoperative DVT/PE (PSI #12)	Numerator (inclusion, DVT/PE)	Added new (FY2005) codes 453.40 "unspecified site", 453.41 "proximal" and 453.42 "distal" to the numerator inclusion criteria for venous embolism and thrombosis of deep vessels of the lower extremity. Expected impact on rate: negligible.
Postoperative Wound Dehiscence (PSI #14)	Denominator (inclusion, abdominopelvic surgery)	For discharges beginning in FY 2005, ICD-9-CM code 44.99 "other gastric operation" is added to the denominator definition of abdominopelvic surgery because laparoscopic procedures that previously dominated this code were re-assigned to other codes. Note: Revision 3 adds optional data elements YEAR (year of patient discharge) and DQTR (calendar quarter of patient discharge) to the input data file specifications. If available, these data elements are used to include ICD-9-CM code 44.99 in the denominator for discharges occurring on or after 10/1/2004. However, ICD-9 code 44.99 will not be retained in the denominator if the data elements year and quarter of discharge are not available or if the user selects the option not to retain code 44.99 for purposes of trending over time or to maintain historical continuity in the rate. However, users are encouraged to transition to the new definition as soon as possible.

Indicator Name (#)	Component	Change
		Expected impact on rate: may result in a increase in the denominator and resulting increase in the rate due to the significant risk of wound dehiscence in the open procedures retained in this code.
Multiple Indicators	Surgical discharges denominator inclusion	Added new (FY2005) DRG codes 541-543 to the surgical discharges inclusion criteria for the applicable PSIs: 1, 3, 5-13, 15-16, 21-23, and 25-26. Expected impact on rate: negligible
Multiple Indicators	Surgical discharges denominator inclusion	Added new (FY2005) major operating procedure codes to the surgical discharges inclusion criteria for the applicable PSIs (see above for the list of PSIs). See the document "Operating Room Procedure Codes" at http://www.qualityindicators.ahrq.gov/psi_download.htm for a list of these ICD-9 codes. The new codes can be identified locating the reference date of introduction "Oct 04" behind the ICD-9 code and description. Expected impact on rate: negligible
Multiple Indicators	Co morbidity (other neurological disorders)	Added new (FY2005) codes 347.00 "narcolepsy w/o cataplexy", 347.01 "w/ cataplexy", 347.10 "narcolepsy in conditions classified elsewhere w/o cataplexy" and 347.11 "w/ cataplexy" to the co morbidity inclusion criteria for other neurological disorders. Added new (FY2005) DRG code 543 to the co morbidity exclusion criteria for other neurological disorders. Expected impact on rate: negligible
